- 32-ch optically isolated open collector output (Current Sinking, NPN type)
- DIO response time is about 250 us (4 kHz max.)
- 32-ch optically isolated D/I
- 3000 Vdc isolation voltage
- Card ID function
- Drop-in replacement for PISO-P32C32

### Introduction

The PISO-P32C32U has 32 channels of optically isolated digital inputs and 32 channels of optically isolated digital outputs, arranged into four isolated banks. Each input channel uses a photo-coupler input which allows either internal isolated power supply or external power selected by jumper. Each digital output offers a Darlington transistor. The power supply of the input port may use the external power or the power from the PC side via DC/DC converter. The power supply of the output port should use the external power. The board eliminates ground-loop problems and isolates the host computer from damaging voltages. The PISO-P32C32U is fully compatible with the PISO-P32C32, and users can replace the PISO-P32C32 by the PISO-P32C32U directly without software/driver modification.

The PISO-P32C32U also adds a Card ID switch (version 1.1 or above). Users can set Card ID on a board and recognize the board by the ID via software when using two or more PISO-P32C32U cards in one computer.
