REGULATORY COMPLIANCE STATEMENT

Product(s) associated with this publication complies/comply with all applicable regulations. Please refer to the Technical Specifications section for more details.

WARRANTY

ORing warrants that all ORing products are free from defects in material and workmanship for a specified warranty period from the invoice date (5 years for most products). ORing will repair or replace products found by ORing to be defective within this warranty period, with shipment expenses apportioned by ORing and the distributor. This warranty does not cover product modifications or repairs done by persons other than ORing-approved personnel, and this warranty does not apply to ORing products that are misused, abused, improperly installed, or damaged by accidents.

Please refer to the Technical Specifications section for the actual warranty period(s) of the product(s) associated with this publication.

DISCLAIMER

Information in this publication is intended to be accurate. ORing shall not be responsible for its use or infringements on third-parties as a result of its use. There may occasionally be unintentional errors on this publication. ORing reserves the right to revise the contents of this publication without notice.

Getting to Know Your Switch

1.1 About the IGPS-7084GP Series Industrial Switch

The IGPS-7084GP series are powerful managed industrial switches which have many features. These switches can work under wide temperature, dusty environment and humid condition. They can be managed by WEB, TELNET, Consol or other third-party SNMP software as well.

1.2 Software Features

- World's fastest Redundant Ethernet Ring (Recovery time < 10ms over 250 units connection)
- Supports Ring Coupling, Dual Homing, RSTP over Ring
- Supports SNMPv1/v2/v3 & RMON & Port base/802.1Q VLAN Network Management
- Event notification by Email, SNMP trap and Relay Output
- Web-based ,Telnet, Console, CLI configuration
- Enable/disable ports, MAC based port security
- Port based network access control (802.1x)
- VLAN (802.1q) to segregate and secure network traffic
- Radius centralized password management
- SNMPv3 encrypted authentication and access security
- RSTP (802.1w)
- Quality of Service (802.1p) for real-time traffic
- VLAN (802.1q) with double tagging and GVRP supported
- IGMP Snooping for multicast filtering
- Port configuration, status, statistics, mirroring, security
- Remote Monitoring (RMON)
- 802.3at Power over Ethernet P.S.E

1.3 Hardware Features

■ Redundant DC power inputs

Operating Temperature: -40 to 70oC
 Storage Temperature: -40 to 85 °C

■ Operating Humidity: 5% to 95%, non-condensing

Casing: IP-308x 1000Base -T

■ 4 x 1000 Base-X SFP

■ Console Port

■ Dimensions 96.4 (W) x 108.5 (D) x 154 (H) mm (3.8 x 4.2.7 x 6.06 inch)

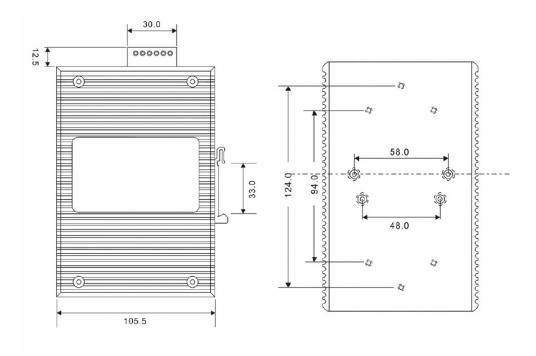

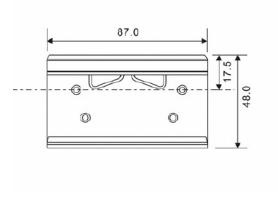

Hardware Installation

2.1 Installing Switch on DIN-Rail

Each switch has a DIN-Rail kit on rear panel. The DIN-Rail kit helps switch to fix on the DIN-Rail. It is easy to install the switch on the DIN-Rail:

2.1.1 Mount IGPS-7084GP on DIN-Rail

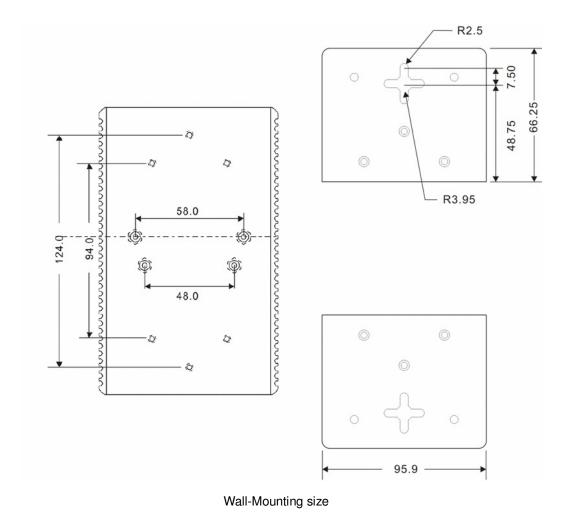

DIN-Rail Size

2.2 Wall Mounting Installation

Each switch has another installation method for users to fix the switch. A wall mount panel can be found in the package. The following steps show how to mount the switch on the wall:

ORing Industrial Networking Corp

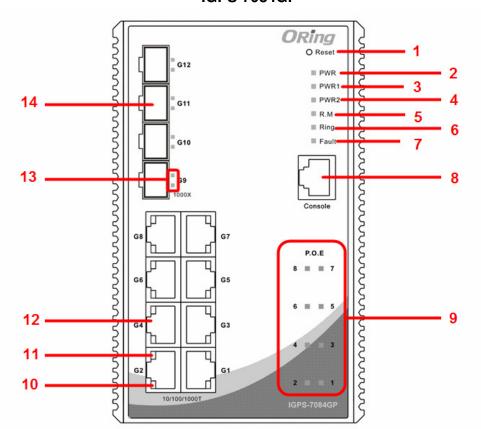

Hardware Overview

3.1 Front Panel

The following table describes the labels that stick on the IGPS-7084GP series.

Port	Description
SFP ports	4 1000BaseX on SFP port
Copper Port	8 1000 Base-T
Console	Use RS-232 with RJ-45 connecter to manage switch.

IGPS-7084GP

- 1. Reset button. Push the button 3 seconds for reset; 5 seconds for factory default.
- 2. LED for PWR. When the PWR UP, the green led will be light on
- 3. LED for PWR1
- 4. LED for PWR2
- 5. LED for R.M (Ring master). When the LED light on, it means that the switch is the ring

master of Ring. , LED for Ring. When the led light on, it means the Ring is activated.

- 6. LED for Ring. When the led light on, it means the O-Ring is activated.
- 7. LED for Fault. When the light on, it means Power failure or Port down/fail.
- 8. Console port (RJ-45)
- 9. LED for P.O.E Status.
- 10. LED for Ethernet ports link status.
- 11. LED for Ethernet ports speed status
- 12. 10/100/1000Base-T(X) ports
- 13. LED for SFP ports link status.
- 14. 1000 Base-X SFP

3.2 Front Panel LEDs

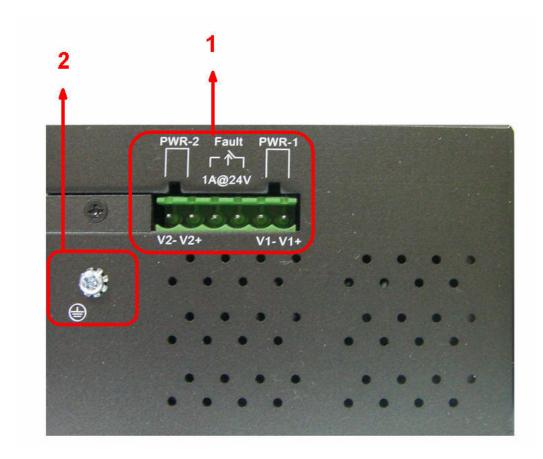

LED	Color	Status	Description
PWR	Green	On	DC power module up
PW1	Green	On	DC power module 1activated.
PW2	Green	On	DC Power module 2activated.
R.M	Green	On	Ring Master.
		On	Ring enabled.
Ring	Green	01 1 11: 1:	Ring has only One link. (lack
nilig	Green	Slowly blinking	of one link to build the ring.)
		Fast blinking	Ring work normally.
Fault	Amber	On	Fault relay. Power failure or
rauit			Port down/fail.
10/100Base-T(X) Fast Ethernet ports			
LNK	Green	On	Port link up.
ACT	Green	Blinking	Data transmitted.
Full Duplex	Amber	On	Port works under full duplex.
Gigabit Ethernet ports			
ACT	Amber	Blinking	Data transmitted.
LNK	Amber	Blinking	Port link up.
SFP			
LNK	Green	On	Port link up.
ACT	Green	On	Data transmitted.

3.3 Top view Panel

The bottom panel components of IGPS-7084GP Series are showed as below:

- 1. Terminal block includes: PWR1, PWR2 (50~57VDC)
- 2. Ground wire

Cables

4.1 Ethernet Cables

The IGPS-7084GP series switches have standard Ethernet ports. According to the link type, the switches use CAT 3, 4, 5,5e UTP cables to connect to any other network device (PCs, servers, switches, routers, or hubs). Please refer to the following table for cable specifications.

Cable Types and Specifications

Cable	Туре	Max. Length	Connector
10BASE-T	Cat. 3, 4, 5 100-ohm	UTP 100 m (328 ft)	RJ-45
100BASE-TX	Cat. 5 100-ohm UTP	UTP 100 m (328 ft)	RJ-45
1000BASE-TX	Cat. 5/Cat. 5e 100-ohm UTP	UTP 100 m (328ft)	RJ-45

4.1.1 100BASE-TX/10BASE-T Pin Assignments

With 100BASE-TX/10BASE-T cable, pins 1 and 2 are used for transmitting data, and pins 3 and 6 are used for receiving data.

10/100 Base-T RJ-45 Pin Assignments

Pin Number	Assignment
1	TD+
2	TD-
3	RD+
4	Not used
5	Not used
6	RD-
7	Not used
8	Not used

1000 Base-T RJ-45 Pin Assignments

Pin Number	Assignment
1	BI_DA+
2	BI_DA-
3	BI_DB+
4	BI_DC+
5	BI_DC-
6	BI_DB-
7	BI_DD+
8	BI_DD-

The IGPS-7084GP Series switches support auto MDI/MDI-X operation. You can use a straight-through cable to connect PC to switch. The following table below shows the 10BASE-T/ 100BASE-TX MDI and MDI-X port pin outs.

10/100 Base-T MDI/MDI-X pins assignment

Pin Number	MDI port	MDI-X port
1	TD+(transmit)	RD+(receive)
2	TD-(transmit)	RD-(receive)
3	RD+(receive)	TD+(transmit)
4	Not used	Not used
5	Not used	Not used
6	RD-(receive)	TD-(transmit)
7	Not used	Not used
8	Not used	Not used

1000 Base-T MDI/MDI-X pins assignment

Pin Number	MDI port	MDI-X port
1	BI_DA+	BI_DB+
2	BI_DA-	BI_DB-
3	BI_DB+	BI_DA+
4	BI_DC+	BI_DD+
5	BI_DC-	BI_DD-
6	BI_DB-	BI_DA-
7	BI_DD+	BI_DC+
8	BI_DD-	BI_DC-

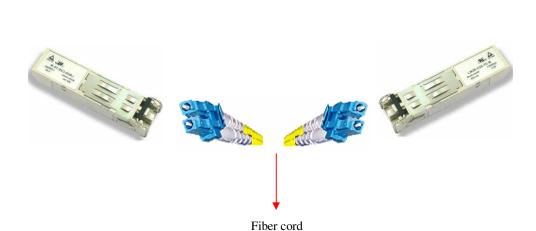

Note: "+" and "-" signs represent the polarity of the wires that make up each wire pair.

Switch B

4.2 SFP

The Switch has fiber optical ports with SFP connectors. The fiber optical ports are in multi-mode (0 to 550M, 850 nm with 50/125 μ m, 62.5/125 μ m fiber) and single-mode with LC connector. Please remember that the TX port of Switch A should be connected to the RX port of Switch B.

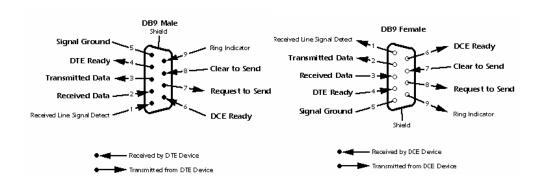

4.3 Console Cable

Switch A

IGPS-7084GP Series switches can be management by console port. The DB-9 to RJ-45 cable can be found in the package. You can connect them to PC via a RS-232 cable with DB-9 female connector and the other end (RJ-45 connector) connects to console port of switch.

PC pin out (male) assignment	RS-232 with DB9 female connector	DB9 to RJ 45
Pin #2 RD	Pin #2 TD	Pin #2
Pin #3 TD	Pin #3 RD	Pin #3
Pin #5 GD	Pin #5 GD	Pin #5

WEB Management

5.1 Configuration by Web Browser

This section introduces the configuration by Web browser.

5.1.1 About Web-based Management

An embedded HTML web site resides in flash memory on the CPU board. It contains advanced management features and allows you to manage the switch from anywhere on the network through a standard web browser such as Microsoft Internet Explorer.

The Web-Based Management function supports Internet Explorer 5.0 or later. It is based on Java Applets with an aim to reduce network bandwidth consumption, enhance access speed and present an easy viewing screen.

Note: By default, IE5.0 or later version does not allow Java Applets to open sockets. You need to explicitly modify the browser setting in order to enable Java Applets to use network ports.

Preparing for Web Management

The default value is as below:

IP Address: **192.168.10.1** Subnet Mask: **255.255.255.0**

Default Gateway: 192.168.10.254

User Name: admin
Password: admin

System Login

- Launch the Internet Explorer.
- Type http:// and the IP address of the switch. Press "Enter".

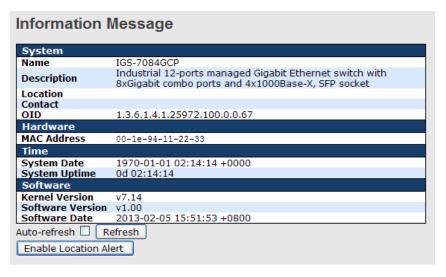

- 3. The login screen appears.
- 4. Key in the username and password. The default username and password is "admin".
- 5. Click "Enter" or "OK" button, then the main interface of the Web-based management appears.

Login screen

Main Interface

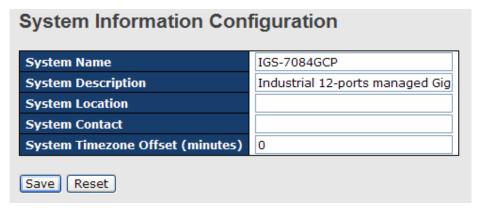

Main interface

5.1.2 Basic Setting

5.1.2.1 System Information

The switch system information is provided here.

System Information interface

Label Description The textual identification of the contact person for this managed node, together with information on how to contact this person. **System Contact** The allowed string length is 0 to 255, and the allowed content is the ASCII characters from 32 to 126. An administratively assigned name for this managed node. By convention, this is the node's fully-qualified domain name. A domain name is a text string drawn from the alphabet (A-Za-z), **System Name** digits (0-9), minus sign (-). No space characters are permitted as part of a name. The first character must be an alpha character. And the first or last character must not be a minus sign. The allowed string length is 0 to 255. The physical location of this node(e.g., telephone closet, 3rd **System Location** floor). The allowed string length is 0 to 255, and the allowed content is the ASCII characters from 32 to 126. Enter the name of contact person or organization Provide the timezone offset relative to UTC/GMT. **Timezone Offset** The offset is given in minutes east of GMT. The valid range is from -720 to 720 minutes. Save Click to save changes.

Reset Click to undo any changes made locally and revert to previously saved values.

5.1.2.2 Admin&Password

This page allows you to configure the system password required to access the web pages or log in from CLI.

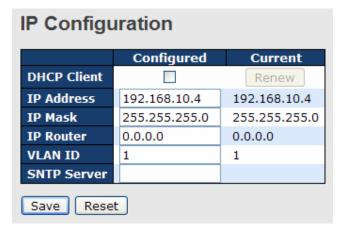

Label	Description
Old Password	Enter the current system password. If this is incorrect, the new
	password will not be set.
New Password	The system password. The allowed string length is 0 to 31, and
	the allowed content is the ASCII characters from 32 to 126.
Confirm password	Re-type the new password.
Save	Click to save changes.

5.1.2.3 IP Setting

Configure the switch-managed IP information on this page.

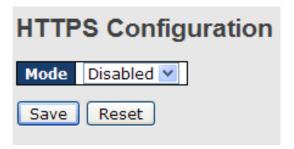

Label	Description
DHCP Client	Enable the DHCP client by checking this box. If DHCP fails and
	the configured IP address is zero, DHCP will retry. If DHCP fails
	and the configured IP address is non-zero, DHCP will stop and
	the configured IP settings will be used. The DHCP client will
	announce the configured System Name as hostname to provide
	DNS lookup.
IP Address	Assign the IP address that the network is using. If DHCP client
	function is enabling, you do not need to assign the IP address.
	The network DHCP server will assign the IP address for the
	switch and it will be display in this column. The default IP is
	192.168.10.1
IP Mask	Assign the subnet mask of the IP address. If DHCP client function
	is enabling, you do not need to assign the subnet mask
IP Router	Assign the network gateway for the switch. The default gateway
	is 192.168.10.254
VLAN ID	Provide the managed VLAN ID. The allowed range is 1 through
	4095.
SNTP Server	SNTP is an acronym for Simple Network Time Protocol, a network
	protocol for synchronizing the clocks of computer systems. SNTP
	uses UDP (datagrams) as transport layer.
Save	Click to save changes.

Reset	Click to undo any changes made locally and revert to previously saved values.
Renew	Click to renew DHCP. This button is only available if DHCP is enabled.

5.1.2.4 HTTPS

Label	Description
	Indicates the HTTPS mode operation. Possible modes are:
Mode	Enabled: Enable HTTPS mode operation.
	Disabled: Disable HTTPS mode operation.
Save	Click to save changes.
Reset	Click to undo any changes made locally and revert to previously
Reset	saved values.

5.1.2.5 SSH

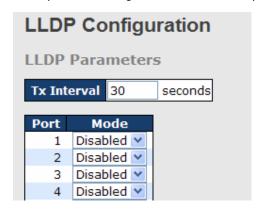

Label	Description
	Indicates the SSH mode operation. Possible modes are:
Mode	Enabled: Enable SSH mode operation.
	Disabled: Disable SSH mode operation.
Save	Click to save changes.
Reset	Click to undo any changes made locally and revert to previously
7.5501	saved values.

5.1.2.6 LLDP

LLDP Configuration

This page allows the user to inspect and configure the current LLDP port settings.

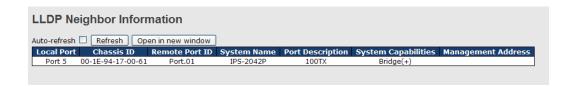

Label	Description
Port	The switch port number of the logical LLDP port.
Mode	Select LLDP mode.

Rx only The switch will not send out LLDP information, but LLDP
information from neighbor units is analyzed.
Tx only The switch will drop LLDP information received from
neighbors, but will send out LLDP information.
Disabled The switch will not send out LLDP information, and will
drop LLDP information received from neighbors.
Enabled The switch will send out LLDP information, and will
analyze LLDP information received from neighbors.

LLDP Neighbor Information

This page provides a status overview for all LLDP neighbors. The displayed table contains a row for each port on which an LLDP neighbor is detected. The columns hold the following information:

Label	Description
Local Port	The port on which the LLDP frame was received.
Chassis ID	The Chassis ID is the identification of the neighbor's LLDP
Cild55i5 ID	frames.
Remote Port ID	The Remote Port ID is the identification of the neighbor port.
System Name	System Name is the name advertised by the neighbor unit.
Port Description	Port Description is the port description advertised by the neighbor
Port Description	unit.
	System Capabilities describes the neighbor unit's capabilities.
	The possible capabilities are:
	1. Other
System Capabilites	2. Repeater
	3. Bridge
	4. WLAN Access Point
	5. Router
	6. Telephone

	7. DOCSIS cable device
	8. Station only
	9. Reserved
	When a capability is enabled, the capability is followed by (+). If
	the capability is disabled, the capability is followed by (-).
	Management Address is the neighbor unit's address that is used
Management	for higher layer entities to assist the discovery by the network
Address	management. This could for instance hold the neighbor's IP
	address.
Refresh	Click to refresh the page immediately.
	Check this box to enable an automatic refresh of the page at
Auto-refresh	regular intervals.

LLDP Statistics

This page provides an overview of all LLDP traffic.

Two types of counters are shown. Global counters are counters that refer to the whole stack, switch, while local counters refer to counters for the currently selected switch.

Global Counters

Label	Description
Neighbor entries were last changed at	Shows the time for when the last entry was last deleted or added. It is also shows the time elaP.S.E.d since last change was detected.
Total Neighbors	Shows the number of new entries added since switch reboot.

Entries Added	
Total Neighbors	Shows the number of new entries deleted since switch reboot.
Entries Deleted	
Total Neighbors	Shows the number of LLDP frames dropped due to that the entry
Entries Dropped	table was full.
Total Neighbors	Shows the number of entries deleted due to Time-To-Live
Entries Aged Out	expiring.

Local Counters

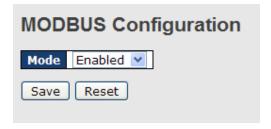

Label	Description
Local Port	The port on which LLDP frames are received or transmitted.
Tx Frames	The number of LLDP frames transmitted on the port.
Rx Frames	The number of LLDP frames received on the port.
Rx Errors	The number of received LLDP frames containing some kind of error.
Frames Discarded	If an LLDP frame is received on a port, and the switch's internal table has run full, the LLDP frame is counted and discarded. This situation is known as "Too Many Neighbors" in the LLDP standard. LLDP frames require a new entry in the table when the Chassis ID or Remote Port ID is not already contained within the table. Entries are removed from the table when a given port links down, an LLDP shutdown frame is received, or when the entry ages out.
TLVs Discarded	Each LLDP frame can contain multiple pieces of information, known as TLVs (TLV is short for "Type Length Value"). If a TLV is malformed, it is counted and discarded.
TLVs Unrecognized	The number of well-formed TLVs, but with an unknown type value.
Org. Discarded	The number of organizationally TLVs received.
Age-Outs	Each LLDP frame contains information about how long time the LLDP information is valid (age-out time). If no new LLDP frame is received within the age out time, the LLDP information is removed, and the Age-Out counter is incremented.
Refresh	Click to refresh the page immediately.
Clear	Clears the local counters. All counters (including global counters) are cleared upon reboot.

Auto-refresh Check this box to enable an automatic refresh of the page at regular intervals.

5.1.2.7 Modbus TCP

Support Modbus TCP .(About Modbus please reference http://www.modbus.org/)

The following table describes the labels in this screen.

Label	Description
Mode	Enable or Disalble Modbus TCP function

5.1.2.8 Backup/Restore Configuration

You can save/view or load the switch configuration. The configuration file is in XML format with a hierarchy of tags:

5.1.2.9 Firmware Update

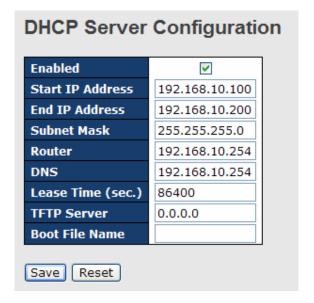

This page facilitates an update of the firmware controlling the stack. switch.

5.1.3 DHCP Server

5.1.3.1 **Setting**

The system provides with DHCP server function. Enable the DHCP server function, the switch system will be a DHCP server.

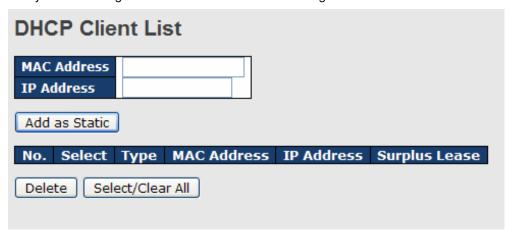

5.1.3.2 DHCP Dynamic Client List

When the DHCP server function is activated, the system will collect the DHCP client information and display in here.

5.1.3.3 DHCP Client List

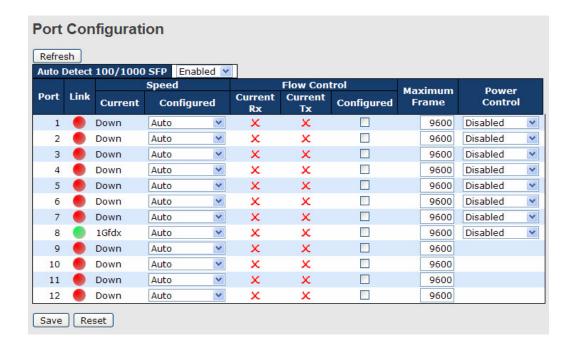

You can assign the specific IP address which is in the assigned dynamic IP range to the specific port. When the device is connecting to the port and asks for dynamic IP assigning, the system will assign the IP address that has been assigned before in the connected device.

5.1.4 Port Setting 5.1.4.1 Port Control

This page displays current port configurations. Ports can also be configured here.

Label	Description
Port	This is the logical port number for this row.
Link	The current link state is displayed graphically. Green indicates the
LITIK	link is up and red that it is down.
Current Link Speed	Provides the current link speed of the port.
	Select any available link speed for the given switch port.
Configured Link	Auto Speed selects the highest speed that is compatible with a
Speed	link partner.
	Disabled disables the switch port operation.
	When Auto Speed is selected for a port, this section indicates the
	flow control capability that is advertised to the link partner.
	When a fixed-speed setting is selected, that is what is used. The
Flow Control	Current Rx column indicates whether pause frames on the port
1 low Control	are obeyed, and the Current Tx column indicates whether pause
	frames on the port are transmitted. The Rx and Tx settings are
	determined by the result of the last Auto-Negotiation.
	Check the configured column to use flow control. This setting is

	,
	related to the setting for Configured Link Speed.
Maximum Frame	Enter the maximum frame size allowed for the switch port,
waxiiiuiii i iaiiie	including FCS. The allowed range is 1518 bytes to 9600 bytes.
Excessive Collsion	Configure port transmit collision behavior.
	Discard: Discard frame after 16 collisions (default).
Mode	Restart: Restart backoff algorithm after 16 collisions.
	The Usage column shows the current percentage of the power
	consumption per port. The Configured column allows for changing
	the power savings mode parameters per port.
Power Control	Disabled: All power savings mechanisms disabled.
	ActiPHY: Link down power savings enabled.
	PerfectReach: Link up power savings enabled.
	Enabled: Both link up and link down power savings enabled.
Total Power Usage	Total power usage in board, measured in percent.
Save :	Click to save changes.
Reset	Click to undo any changes made locally and revert to previously
	saved values.
Defeat	Click to refresh the page. Any changes made locally will be
Refresh	undone.

5.1.4.2 Rate Limit

Configure the switch port rate limit for Policers and Shapers on this page.

Rate Limit Configuration Policer Policer Policer Shaper Shaper Shaper **Port** Enabled Rate Unit **Enabled** Rate Unit kbps 💌 1 500 kbps 💌 500 2 500 kbps 💌 500 kbps 💌 kbps 💌 kbps 💌 3 500 500 4 500 kbps 💌 500 kbps 💌 5 500 kbps 💌 500 kbps 💌 6 500 kbps 💌 500 kbps 💌 7 kbps 💌 500 kbps 💌 500 8 kbps 💌 500 500 kbps 💌 9 500 500 kbps 💌 kbps 💌 10 500 kbps 💌 500 kbps 💌

Label	Description	
Port	The logical port for the settings contained in the same row.	
Policer Enabled	Enable or disable the port policer. The default value is "Disabled".	
	Configure the rate for the port policer. The default value is "500".	
Policer Rate	This value is restricted to 500-1000000 when the "Policer Unit" is	
Policer hate	"kbps", and it is restricted to 1-1000 when the "Policer Unit" is	
	"Mbps"	
Policer Unit	Configure the unit of measure for the port policer rate as kbps or	
Policer Offit	Mbps. The default value is "kbps".	
Shaper Enabled	Enable or disable the port shaper. The default value is "Disabled".	
	Configure the rate for the port shaper. The default value is "500".	
Shapar Pata	This value is restricted to 500-1000000 when the "Policer Unit" is	
Shaper Rate	"kbps", and it is restricted to 1-1000 when the "Policer Unit" is	
	"Mbps"	
Shanar Unit	Configure the unit of measure for the port shaper rate as kbps or	
Shaper Unit	Mbps. The default value is "kbps".	
Save :	Click to save changes.	
Reset	Click to undo any changes made locally and revert to previously	
Reset	saved values.	

5.1.4.3 Port Trunk

5.1.4.3.1 Trunk Configuration

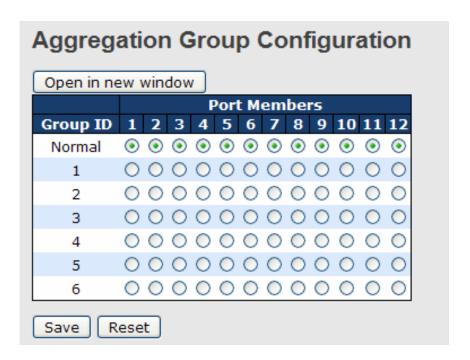

This page is used to configure the Aggregation hash mode and the aggregation group.

Label	Description									
Source MAC Address	The	Source	MAC	address	can	be	used	to	calculate	the
	desti	nation po	ort for	the frame	e. Che	eck	to enal	ole	the use of	the

	Source MAC address, or uncheck to disable. By default, Source
	MAC Address is enabled.
Destination MAC	The Destination MAC Address can be used to calculate the
Address	destination port for the frame. Check to enable the use of the
	Destination MAC Address, or uncheck to disable. By default,
	Destination MAC Address is disabled.
IP Address	The IP address can be used to calculate the destination port for
	the frame. Check to enable the use of the IP Address, or uncheck
	to disable. By default, IP Address is enabled.
TCP/UDP Port	The TCP/UDP port number can be used to calculate the
Number	destination port for the frame. Check to enable the use of the
	TCP/UDP Port Number, or uncheck to disable. By default,
	TCP/UDP Port Number is enabled.

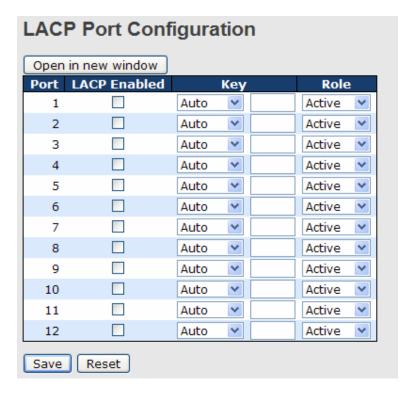

Label	Description	
Group ID	Indicates the group ID for the settings contained in the same row	
	Group ID "Normal" indicates there is no aggregation. Only one	
	group ID is valid per port.	
Port Members	Each switch port is listed for each group ID. Select a radio button	
	to include a port in an aggregation, or clear the radio button to	
	remove the port from the aggregation. By default, no ports belong	

to any aggregation group. Only full duplex ports can join an aggregation and ports must be in the same speed in each group.

5.1.4.3.2 LACP Port Configuration

This page allows the user to inspect the current LACP port configurations, and possibly change them as well.

Label	Description
Port	Indicates the group ID for the settings contained in the same row.
	Group ID "Normal" indicates there is no aggregation. Only one
	group ID is valid per port.
LACP Enabled	Each switch port is listed for each group ID. Select a radio button
	to include a port in an aggregation, or clear the radio button to
	remove the port from the aggregation. By default, no ports belong
	to any aggregation group. Only full duplex ports can join an
	aggregation and ports must be in the same speed in each group.
Key	The Key value incurred by the port, range 1-65535 . The Auto
	setting will set the key as appropriate by the physical link speed,
	10Mb = 1, 100Mb = 2, 1Gb = 3. Using the Specific setting, a
	user-defined value can be entered. Ports with the same Key value

	can participate in the same aggregation group, while ports with
	different keys cannot.
Role	The Role shows the LACP activity status. The Active will transmit
	LACP packets each second, while Passive will wait for a LACP
	packet from a partner (speak if spoken to).
Save :	Click to save changes.
Reset	Click to undo any changes made locally and revert to previously
Keset	saved values.

5.1.4.3.3 LACP System Status

This page provides a status overview for all LACP instances.

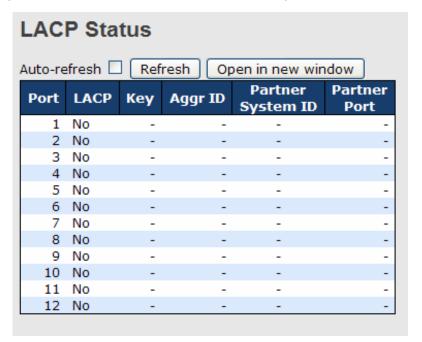

Label	Description			
Aggr ID	The Aggregation ID associated with this aggregation instance. For			
	LLAG the id is shown as 'isid:aggr-id' and for GLAGs as 'aggr-id'			
Partner System ID	The system ID (MAC address) of the aggregation partner.			
Partner Key	The Key that the partner has assigned to this aggregation ID.			
Last Changed	The time since this aggregation changed.			
Last Channged	Shows which ports are a part of this aggregation for this			
	switch/stack. The format is: "Switch ID:Port".			
Refresh :	Click to refresh the page immediately.			
Auto-refresh :	Check this box to enable an automatic refresh of the page at			
Auto-reliesh	regular intervals.			

5.1.4.3.4 LACP Status

This page provides a status overview for LACP status for all ports.

Label	Description
Port	The switch port number.
LACP	'Yes' means that LACP is enabled and the port link is up. 'No'
	means that LACP is not enabled or that the port link is down.
	'Backup' means that the port could not join the aggregation group
	but will join if other port leaves. Meanwhile it's LACP status is
	disabled.
Key	The key assigned to this port. Only ports with the same key can
	aggregate together.
Aggr ID	The Aggregation ID assigned to this aggregation group.
Partner System ID	The partners System ID (MAC address).
Partner Port	The partners port number connected to this port.
Refresh	Click to refresh the page immediately.
Auto-refresh :	Check this box to enable an automatic refresh of the page at
	regular intervals.

5.1.4.3.5 LACP Statistics

This page provides an overview for LACP statistics for all ports.

LACP Statistics					
Auto-re	fresh 🗌 Refre				
Port	LACP	LACP	Discar		
	Transmitted	Received	Unknown	Illegal	
1	0	0	0	0	
2	0	0	0	0	
3	0	0	0	0	
4	0	0	0	0	
5	0	0	0	0	
6	0	0	0	0	
7	0	0	0	0	
8	0	0	0	0	
9	0	0	0	0	
10	0	0	0	0	
11	0	0	0	0	
12	0	0	0	0	

Label	Description
Port	The switch port number
LACP Transmitted	Shows how many LACP frames have been sent from each port
LACP Received	Shows how many LACP frames have been received at each port.
Discarded	Shows how many unknown or illegal LACP frames have been
	discarded at each port.
Refresh	Click to refresh the page immediately.
Auto-refresh 🗆	Check this box to enable an automatic refresh of the page at
Auto-refresh .	regular intervals.
Clear	Clears the counters for all ports

5.1.4.4 Loop Gourd

This feature prevents the loop attack, When the port receives loop packet. This port will auto disable , prevent the "loop attack" affect other network devices

Loop Guard		
Port	Active	Port State
1		-
2		-
3		-
4		-

Label	Description
Active	Loop Guard Enable or Disable
Port Status	Port work status.

5.1.5 Redundancy

5.1.5.1 MRP

MRP (Media Redundancy Protocol) Ring (IEC 62439) of up to 50 devices typically transforms back to a line structure within 80 ms (adjustable to max. 200 ms/500 ms).

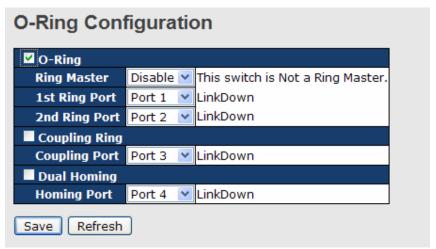

Label	Description
Enable	Enabling the MRP function
Manager	MRP Master , every one MRP topology , need setting one
	device to Manager.(one MRP topology only can setting one
	device to Manager, if user setting two or more switch to
	Manager, this MRP topology will fail.)

React on Link Change	Faster mode, if user enable this function, MRP Topology will
(Advanced mode)	more faster convergence, this function only can setting in MRP
	Manager Switch.
1 st Ring Port	Choosing the port which connect to the MRP ring
2 nd Ring Port	Choosing the port which connect to the MRP ring

5.1.5.2 O-Ring

Ring is the most powerful Ring in the world. The recovery time of Ring is less than 10 ms. It can reduce unexpected damage caused by network topology change. Ring Supports 3 Ring topology: Ring, Coupling Ring and Dual Homing.

Ring interface

The following table describes the labels in this screen.

Label	Description
Redundant Ring	Mark to enable Ring.
	There should be one and only one Ring Master in a ring.
	However if there are two or more switches which set Ring
Ring Master	Master to enable, the switch with the lowest MAC address will
	be the actual Ring Master and others will be Backup Masters.
1 st Ring Port	The primary port, when this switch is Ring Master.
2 nd Ring Port	The backup port, when this switch is Ring Master.
Coupling Ring	Mark to enable Coupling Ring. Coupling Ring can be used to
	divide a big ring into two smaller rings to avoid effecting all
	switches when network topology change. It is a good
	application for connecting two Rings.

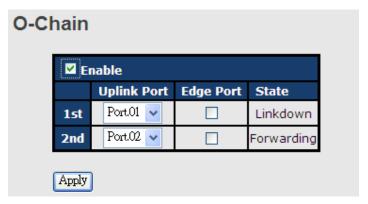

Coupling Port	Link to Coupling Port of the switch in another ring. Coupling
	Ring need four switch to build an active and a backup link.
	Set a port as coupling port. The coupled four ports of four
	switches will be run at active/backup mode.
Dual Homing	Mark to enable Dual Homing. By selecting Dual Homing
	mode, Ring will be connected to normal switches through
	two RSTP links (ex: backbone Switch). The two links work as
	active/backup mode, and connect each Ring to the normal
	switches in RSTP mode.
Apply	Click "Apply" to set the configurations.

Note: We don't suggest you to set one switch as a Ring Master and a Coupling Ring at the same time due to heavy load.

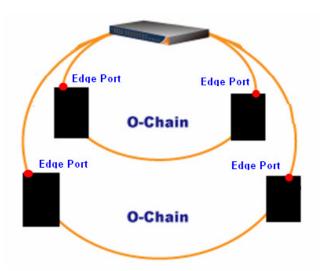

5.1.5.3 O-Chain

O-Chain is the revolutionary network redundancy technology that provides the add-on network redundancy topology for any backbone network, providing ease-of-use while maximizing fault-recovery swiftness, flexibility, compatibility, and cost-effectiveness in one set of network redundancy topologies O-Chain allows multiple redundant network rings of different redundancy protocols to join and function together as a larger and more robust compound network topology, i.e. the creation of multiple redundant networks beyond the limitations of current redundant ring technology.

Label	Description
Enable	Enabling the O-Chain function
1 st Ring Port	Choosing the port which connect to the ring
2 nd Ring Port	Choosing the port which connect to the ring
Edge Port	In the O-Chain application, the head and tail of two Switch Port,
	must start the Edge,MAC smaller Switch, Edge port will be the
	backup and RM LED Light.

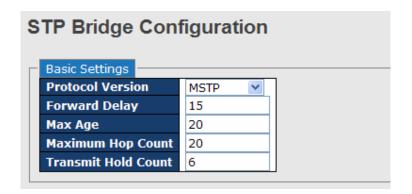

5.1.5.4 MSTP

Bridge Settings

This page allows you to configure RSTP system settings. The settings are used by all RSTP Bridge instances in the Switch Stack.

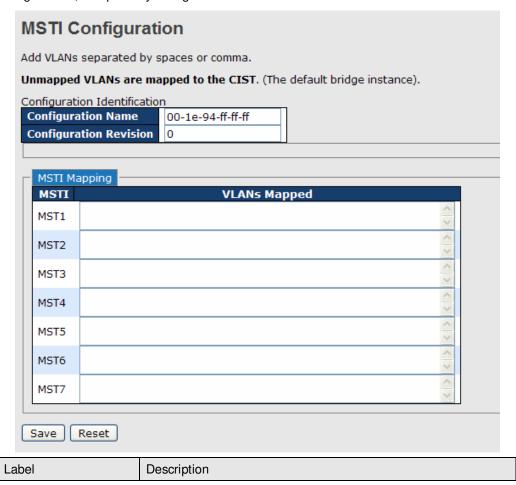

Label	Description
Protocol Version	The STP protocol version setting. Valid values are STP, RSTP
	and MSTP.
	The delay used by STP Bridges to transition Root and Designated
Forward Delay	Ports to Forwarding (used in STP compatible mode). Valid values
	are in the range 4 to 30 seconds.
	The maximum age of the information transmitted by the Bridge
Max Age	when it is the Root Bridge. Valid values are in the range 6 to 40
	seconds, and MaxAge must be <= (FwdDelay-1)*2.
Maximum Hop Count	This defines the initial value of remainingHops for MSTI

	information generated at the boundary of an MSTI region. It
	defines how many bridges a root bridge can distribute its BPDU
	information. Valid values are in the range 4 to 30 seconds, and
	MaxAge must be <= (FwdDelay-1)*2.
	The number of BPDU's a bridge port can send per second. When
Transmit Hold Count	exceeded, transmission of the next BPDU will be delayed. Valid
	values are in the range 1 to 10 BPDU's per second.
Save	Click to save changes.
Reset	Click to undo any changes made locally and revert to previously
	saved values.

MSTI Mapping

This page allows the user to inspect the current STP MSTI bridge instance priority configurations, and possibly change them as well.

	The name identifiying the VLAN to MSTI mapping. Bridges must
	share the name and revision (see below), as well as the
Configuration Name	VLAN-to-MSTI mapping configuration in order to share spanning
	trees for MSTI's. (Intra-region). The name is at most 32
	characters.
Configuration	The revision of the MSTI configuration named above. This must
Revision	be an integer between 0 and 65535.
MSTI	The bridge instance. The CIST is not available for explicit
WISTI	mapping, as it will receive the VLANs not explicitly mapped.
	The list of VLAN's mapped to the MSTI. The VLANs must be
VI ANG Mannad	separated with comma and/or space. A VLAN can only be
VLANS Mapped	mapped to one MSTI. An unused MSTI should just be left empty.
	(I.e. not having any VLANs mapped to it.)
Save	Click to save changes.
Reset	Click to undo any changes made locally and revert to previously
	saved values.

MSTI Priorities

This page allows the user to inspect the current STP MSTI bridge instance priority configurations, and possibly change them as well.

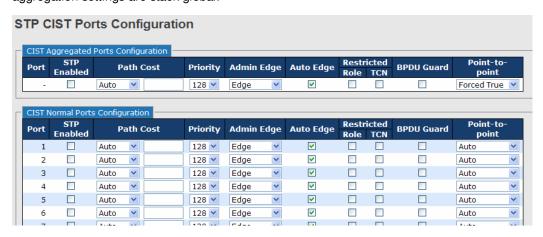

Label	Description

MSTI	The bridge instance. The CIST is the default instance, which is always active.
Priority	Controls the bridge priority. Lower numerical values have better priority. The bridge priority plus the MSTI instance number, concatenated with the 6-byte MAC address of the switch forms a Bridge Identifier.
Save	Click to save changes.
Reset	Click to undo any changes made locally and revert to previously saved values.

CIST Ports

This page allows the user to inspect the current STP CIST port configurations, and possibly change them as well. This page contains settings for physical and aggregated ports. The aggregation settings are stack global.

Label	Description			
Port The switch port number of the logical STP port.				
STP Enabled	Controls whether STP is enabled on this switch port.			
	Controls the path cost incurred by the port. The Auto setting will			
	set the path cost as appropriate by the physical link speed, using			
Path Cost	the 802.1D recommended values. Using the Specific setting, a			
ratii Cost	user-defined value can be entered. The path cost is used when			
	establishing the active topology of the network. Lower path cost			
	ports are chosen as forwarding ports in favor of higher path cost			

	ports. Valid values are in the range 1 to 200000000.
	Controls the port priority. This can be used to control priority of
Priority	ports having identical port cost. (See above).
	Operational flag describing whether the port is connecting directly
OpenEdge(setate	to edge devices. (No Bridges attached). Transitioning to the
flag)	forwarding state is faster for edge ports (having operEdge true)
	than for other ports.
AdminEdge	Controls whether the operEdge flag should start as beeing set or
AdminEdge	cleared. (The initial operEdge state when a port is initialized).
	Controls whether the bridge should enable automatic edge
AutoEdge	detection on the bridge port. This allows operEdge to be derived
	from whether BPDU's are received on the port or not.
	If enabled, causes the port not to be selected as Root Port for the
	CIST or any MSTI, even if it has the best spanning tree priority
	vector. Such a port will be selected as an Alternate Port after the
	Root Port has been selected. If set, it can cause lack of spanning
Restricted Role	tree connectivity. It can be set by a network administrator to
	prevent bridges external to a core region of the network
	influencing the spanning tree active topology, possibly because
	those bridges are not under the full control of the administrator.
	This feature is also know as Root Guard.
	If enabled, causes the port not to propagate received topology
	change notifications and topology changes to other ports. If set it
	can cause temporary loss of connectivity after changes in a
	spanning trees active topology as a result of persistent incorrectly
Postricted TCN	learned station location information. It is set by a network
Restricted ICN	administrator to prevent bridges external to a core region of the
	network, causing address flushing in that region, possibly
	because those bridges are not under the full control of the
	administrator or is the physical link state for the attached LANs
	transitions frequently.
	Controls whether the port connects to a point-to-point LAN rather
Point2Point	than a shared medium. This can be automatically determined, or
FointzFoint	forced either true or false. Transition to the forwarding state is
	faster for point-to-point LANs than for shared media.
Save	Click to save changes.

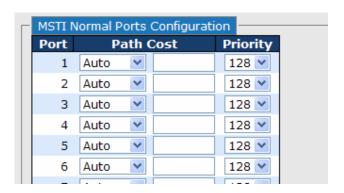

Click to undo any changes made locally and revert to previously saved values.

MSTI Ports

This page allows the user to inspect the current STP MSTI port configurations, and possibly change them as well. A MSTI port is a virtual port, which is instantiated seperately for each active CIST (physical) port for each MSTI instance configured and applicable for the port. The MSTI instance must be selected before displaying actual MSTI port configuration options. This page contains MSTI port settings for physical and aggregated ports. The aggregation settings are stack global.

Label	Description
Port	The switch port number of the corresponding STP CIST (and
Polt	MSTI) port.
	Controls the path cost incurred by the port. The Auto setting will
Dath Coat	set the path cost as appropriate by the physical link speed, using
Path Cost	the 802.1D recommended values. Using the Specific setting, a
	user-defined value can be entered. The path cost is used when

	establishing the active topology of the network. Lower path cost		
	ports are chosen as forwarding ports in favor of higher path cost		
	ports. Valid values are in the range 1 to 200000000.		
Delocity	Controls the port priority. This can be used to control priority of		
Priority	ports having identical port cost. (See above).		
Save	Click to save changes.		
Donat	Click to undo any changes made locally and revert to previously		
Reset	saved values.		

STP Bridges

This page provides a status overview for all STP bridge instances.

The displayed table contains a row for each STP bridge instance, where the column displays the following information:

Label	Description		
MSTI	The Bridge Instance. This is also a link to the STP Detailed Bridge		
WISTI	Status.		
Bridge ID	The Bridge ID of this Bridge instance.		
Root ID	The Bridge ID of the currently elected root bridge.		
Root Port	The switch port currently assigned the root port role.		
	Root Path Cost. For the Root Bridge this is zero. For all other		
Root Cost	Bridges, it is the sum of the Port Path Costs on the least cost path		
	to the Root Bridge.		
Topology Flag	The current state of the Topology Change Flag for this Bridge		
торогоду г гад	instance.		
Topology Change	The time since last Topology Change occurred.		
Last			
Refresh :	Click to refresh the page immediately.		

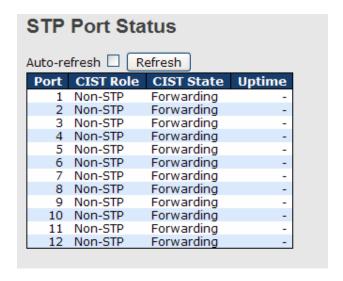

Auto-refresh 🔲

Check this box to enable an automatic refresh of the page at regular intervals.

STP Port Status

This page displays the STP CIST port status for port physical ports in the currently selected switch.

Label	Description		
Port	The switch port number of the logical STP port.		
	The current STP port role of the CIST port. The port role can be		
CIST Role	one of the following values: AlternatePort BackupPort RootPort		
	DesignatedPort.		
01-1-	The current STP port state of the CIST port. The port state can be		
State	one of the following values: Blocking Learning Forwarding.		
Uptime	The time since the bridge port was last initialized.		
Refresh	Click to refresh the page immediately.		
Auto-refresh :	Check this box to enable an automatic refresh of the page at		
	regular intervals.		

STP Statistics

This page displays the RSTP port statistics counters for bridge ports in the currently selected switch.

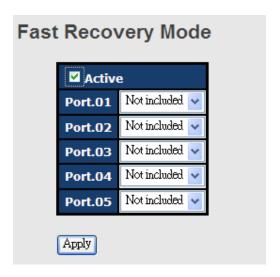

Label	Description					
Port	The switch port number of the logical RSTP port.					
RSTP	The number of RSTP Configuration BPDU's received/transmitted					
noir	on the port.					
STP	The number of legacy STP Configuration BPDU's					
SIP	received/transmitted on the port.					
TCN	The number of (legacy) Topology Change Notification BPDU's					
TON	received/transmitted on the port.					
Discarded Unknown	The number of unknown Spanning Tree BPDU's received (and					
Discarded Officiowif	discarded) on the port.					
Discorded Illogal	The number of illegal Spanning Tree BPDU's received (and					
Discarded Illegal	discarded) on the port.					
Refresh	Click to refresh the mars immediately					
	Click to refresh the page immediately.					
Auto-refresh 🔲	Check this box to enable an automatic refresh of the page at					
Auto-refresh	regular intervals.					

5.1.5.5 Fast Recovery mode

The Fast Recovery Mode can be set to connect multiple ports to one or more switches. The TES-250-M12 with its fast recovery mode will provide redundant links. Fast Recovery mode supports 5 priorities, only the first priority will be the act port, the other ports configured with other priority will be the backup ports.

Fast Recovery Mode interface

The following table describes the labels in this screen.

Label	Description			
Active	Activate the fast recovery mode.			
port	Port can be configured as 5 priorities. Only the port with highest			
	priority will be the active port. 1st Priority is the highest.			
Apply	Click "Apply" to activate the configurations.			

5.1.6 VLAN

5.1.6.1 VLAN Membership Configuration

The VLAN membership configuration for the selected stack switch unit switch can be monitored and modified here. Up to 64 VLANs are supported. This page allows for adding and deleting VLANs as well as adding and deleting port members of each VLAN.

Label	Description					
Delete	Check to delete the entry. It will be deleted during the next save.					
VLAN ID	The VLAN ID for the entry.					
MAC Address	The MAC address for the entry.					
Port Members	Checkmarks indicate which ports are members of the entry. Check or uncheck as needed to modify the entry.					
Adding a New Static Entry	Click Add New VLAN to add a new VLAN ID. An empty row is added to the table, and the VLAN can be configured as needed. Legal values for a VLAN ID are 1 through 4095. The VLAN is enabled on the selected stack switch unit when you click on "Save". The VLAN is thereafter present on the other stack switch units, but with no port members. A VLAN without any port members on any stack unit will be deleted when you click "Save". The Delete button can be used to undo the addition of new VLANs.

5.1.6.2 Private VLAN

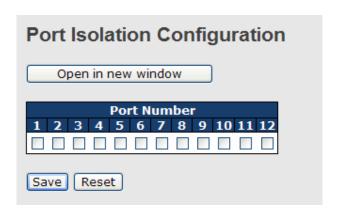

The Private VLAN membership configurations for the switch can be monitored and modified here. Private VLANs can be added or deleted here. Port members of each Private VLAN can be added or removed here. Private VLANs are based on the source port mask, and there are no connections to VLANs. This means that VLAN IDs and Private VLAN IDs can be identical. A port must be a member of both a VLAN and a Private VLAN to be able to forward packets. By default, all ports are VLAN unaware and members of VLAN 1 and Private VLAN 1. A VLAN unaware port can only be a member of one VLAN, but it can be a member of multiple Private VLANs.

Label	Description		
Delete	Check to delete the entry. It will be deleted during the next save.		
Private VLAN ID	Indicates the ID of this particular private VLAN.		
MAC Address	The MAC address for the entry.		
	A row of check boxes for each port is displayed for each private		
Port Members	VLAN ID. To include a port in a Private VLAN, check the box. To		
Port Wembers	remove or exclude the port from the Private VLAN, make sure the		
	box is unchecked. By default, no ports are members, and all		

	boxes are unchecked.		
	Click Add New Private VLAN to add a new private		
	VLAN ID. An empty row is added to the table, and the private		
	VLAN can be configured as needed. The allowed range for a		
	private VLAN ID is the same as the switch port number range.		
Adding a New Static	Any values outside this range are not accepted, and a warning		
Entry	message appears. Click "OK" to discard the incorrect entry, or		
	click "Cancel" to return to the editing and make a correction.		
	The Private VLAN is enabled when you click "Save".		
	The Delete button can be used to undo the addition of new		
	Private VLANs.		

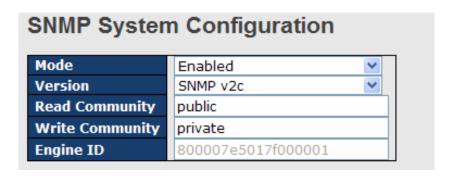

Label	Description
Port Members	A check box is provided for each port of a private VLAN.
	When checked, port isolation is enabled for that port.
	When unchecked, port isolation is disabled for that port.
	By default, port isolation is disabled for all ports.

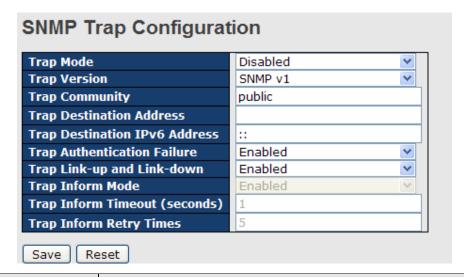

5.1.7 SNMP

5.1.7.1 SNMP-System

Label	Description	
Mode	Indicates the SNMP mode operation. Possible modes are:	
	Enabled: Enable SNMP mode operation.	
	Disabled: Disable SNMP mode operation.	
	Indicates the SNMP supported version. Possible versions are:	
Version	SNMP v1: Set SNMP supported version 1.	
version	SNMP v2c: Set SNMP supported version 2c.	
	SNMP v3: Set SNMP supported version 3.	
	Indicates the community read access string to permit access to	
	SNMP agent. The allowed string length is 0 to 255, and the allowed	
Read Community	content is the ASCII characters from 33 to 126.	
nead Community	The field only suits to SNMPv1 and SNMPv2c. SNMPv3 is using	
	USM for authentication and privacy and the community string will	
	associated with SNMPv3 communities table	
	Indicates the community write access string to permit access to	
	SNMP agent. The allowed string length is 0 to 255, and the allowed	
Write Community	content is the ASCII characters from 33 to 126.	
write Community	The field only suits to SNMPv1 and SNMPv2c. SNMPv3 is using	
	USM for authentication and privacy and the community string will	
	associated with SNMPv3 communities table.	
	Indicates the SNMPv3 engine ID. The string must contain an even	
Engine ID	number between 10 and 64 hexadecimal digits, but all-zeros and	
Liigilie ib	all-'F's are not allowed. Change of the Engine ID will clear all original	
	local users.	

Label	Description	
Trap Mode	Indicates the SNMP trap mode operation. Possible modes are:	
	Enabled: Enable SNMP trap mode operation.	
	Disabled: Disable SNMP trap mode operation.	
	Indicates the SNMP trap supported version. Possible versions are:	
Trap Version	SNMP v1: Set SNMP trap supported version 1.	
Trap version	SNMP v2c: Set SNMP trap supported version 2c.	
	SNMP v3: Set SNMP trap supported version 3.	
	Indicates the community access string when send SNMP trap packet.	
Trap Community	The allowed string length is 0 to 255, and the allowed content is the	
	ASCII characters from 33 to 126.	
Trap Destination	Indicates the SNMP trap destination address.	
Address	Trap Destination IPv6 Address	
	Provide the trap destination IPv6 address of this switch. IPv6 address	
	is in 128-bit records represented as eight fields of up to four	
Trap Destination	hexadecimal digits with a colon separates each field (:). For example,	
IPv6 Address	'fe80:215:c5ff:fe03:4dc7'. The symbol '::' is a special syntax that can	
IF VO Address	be used as a shorthand way of representing multiple 16-bit groups of	
	contiguous zeros; but it can only appear once. It also used a	
	following legally IPv4 address. For example, '::192.1.2.34'.	
Trap	Indicates the SNMP entity is permitted to generate authentication	
Authentication	failure traps. Possible modes are:	
Failure	Enabled: Enable SNMP trap authentication failure.	
i andie	Disabled: Disable SNMP trap authentication failure.	
Trap Link-up and	Indicates the SNMP trap link-up and link-down mode operation.	

Link-down	Possible modes are:	
	Enabled: Enable SNMP trap link-up and link-down mode operation.	
	Disabled: Disable SNMP trap link-up and link-down mode operation.	
	Indicates the SNMP trap inform mode operation. Possible modes	
Trap Inform Mode	are:	
map inform wode	Enabled: Enable SNMP trap inform mode operation.	
	Disabled: Disable SNMP trap inform mode operation.	
Trap Inform	Indicates the SNMP trap inform timeout. The allowed range is 0 to	
Timeout(seconds)	2147.	
Trap Inform Retry	Indicates the SNMP trap inform retry times. The allowed range is 0 to	
Times	255.	
	Indicates the SNMP trap probe security engine ID mode of operation.	
	Possible values are:	
Trap Probe	Enabled: Enable SNMP trap probe security engine ID mode of	
Security Engine ID	operation.	
	Disabled: Disable SNMP trap probe security engine ID mode of	
	operation.	

Trap Security Engine ID	Indicates the SNMP trap security engine ID. SNMPv3 sends traps
	and informs using USM for authentication and privacy. A unique
	engine ID for these traps and informs is needed. When "Trap Probe
	Security Engine ID" is enabled, the ID will be probed automatically.
	Otherwise, the ID specified in this field is used. The string must
	contain an even number between 10 and 64 hexadecimal digits, but
	all-zeros and all-'F's are not allowed.
Trap Security Name	Indicates the SNMP trap security name. SNMPv3 traps and informs
	using USM for authentication and privacy. A unique security name is
	needed when traps and informs are enabled.

5.1.7.2 SNMP-Communities

Configure SNMPv3 communities table on this page. The entry index key is Community.

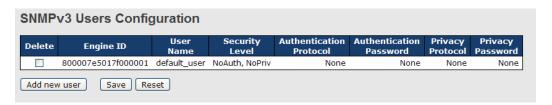

SNMPv3 Communities Configuration			
Delete	Community	Source IP	Source Mask
	public	0.0.0.0	0.0.0.0
	private	0.0.0.0	0.0.0.0
Add new community Save Reset			

Label	Description	
Delete	Check to delete the entry. It will be deleted during the next save.	
	Indicates the community access string to permit access to SNMPv3	
Community	agent. The allowed string length is 1 to 32, and the allowed content is	
	the ASCII characters from 33 to 126.	
Source IP	Source IP Indicates the SNMP access source address.	
Source Mask	Indicates the SNMP access source address mask.	

5.1.7.3 SNMP-Users

Configure SNMPv3 users table on this page. The entry index keys are Engine ID and User Name.

Label	Description	
Delete	Check to delete the entry. It will be deleted during the next save.	
Engine ID	An octet string identifying the engine ID that this entry should belong	
	to. The string must contain an even number between 10 and 64	
	hexadecimal digits, but all-zeros and all-'F's are not allowed. The	
	SNMPv3 architecture uses the User-based Security Model (USM) for	
	message security and the View-based Access Control Model (VACM)	
	for access control. For the USM entry, the usmUserEngineID and	
	usmUserName are the entry's keys. In a simple agent,	
	usmUserEngineID is always that agent's own snmpEngineID value.	

	T
	The value can also take the value of the snmpEngineID of a remote
	SNMP engine with which this user can communicate. In othe words,
	if user engine ID equal system engine ID then it is local user;
	otherwize it's remote user.
	A string identifying the user name that this entry should belong to.
User Name	The allowed string length is 1 to 32, and the allowed content is the
	ASCII characters from 33 to 126.
	Indicates the security model that this entry should belong to. Possible
	security models are:
	NoAuth, NoPriv: None authentication and none privacy.
Security Level	Auth, NoPriv: Authentication and none privacy.
	Auth, Priv: Authentication and privacy.
	The value of security level cannot be modified if entry already exists.
	That means must first ensure that the value is set correctly.
	Indicates the authentication protocol that this entry should belong to.
	Possible authentication protocols are:
	None: None authentication protocol.
A at h at h at h	MD5: An optional flag to indicate that this user using MD5
Authentication	authentication protocol.
Protocol	SHA: An optional flag to indicate that this user using SHA
	authentication protocol.
	The value of security level cannot be modified if entry already exists.
	That means must first ensure that the value is set correctly.
	A string identifying the authentication pass phrase. For MD5
Authentication	authentication protocol, the allowed string length is 8 to 32. For SHA
Password	authentication protocol, the allowed string length is 8 to 40. The
	allowed content is the ASCII characters from 33 to 126.
	Indicates the privacy protocol that this entry should belong to.
	Possible privacy protocols are:
Privacy Protocol	None: None privacy protocol.
	DES: An optional flag to indicate that this user using DES
	authentication protocol.
	A string identifying the privacy pass phrase. The allowed string length
Privacy Password	is 8 to 32, and the allowed content is the ASCII characters from 33 to
,	126.
	:==:

5.1.7.4 SNMP-Groups

Configure SNMPv3 groups table on this page. The entry index keys are Security Model and Security Name.

Label	Description	
Delete	Check to delete the entry. It will be deleted during the next save.	
	Indicates the security model that this entry should belong to. Possible	
	security models are:	
Security Model	v1: Reserved for SNMPv1.	
	v2c: Reserved for SNMPv2c.	
	usm: User-based Security Model (USM).	
	A string identifying the security name that this entry should belong to.	
Security Name	The allowed string length is 1 to 32, and the allowed content is the	
	ASCII characters from 33 to 126.	
	A string identifying the group name that this entry should belong to.	
Group Name	The allowed string length is 1 to 32, and the allowed content is the	
	ASCII characters from 33 to 126.	

5.1.7.5 SNMP-Views

Configure SNMPv3 views table on this page. The entry index keys are View Name and OID Subtree.

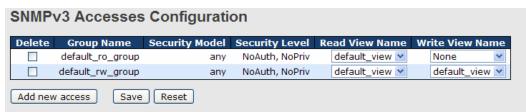

Label	Description	
Delete	Check to delete the entry. It will be deleted during the next save.	
	A string identifying the view name that this entry should belong to.	
View Name	The allowed string length is 1 to 32, and the allowed content is the	
	ASCII characters from 33 to 126.	
	Indicates the view type that this entry should belong to. Possible view	
	types are:	
	included: An optional flag to indicate that this view subtree should be	
	included.	
View Type	excluded: An optional flag to indicate that this view subtree should be	
	excluded.	
	General, if a view entry's view type is 'excluded', it should be exist	
	another view entry which view type is 'included' and it's OID subtree	
	overstep the 'excluded' view entry.	
	The OID defining the root of the subtree to add to the named view.	
OID Subtree	The allowed OID length is 1 to 128. The allowed string content is	
	digital number or asterisk(*).	

5.1.7.6 SNMP-Accesses

Configure SNMPv3 accesses table on this page. The entry index keys are Group Name, Security Model and Security Level.

Label	Description
Delete	Check to delete the entry. It will be deleted during the next save.

	A string identifying the group name that this entry should belong to.
Group Name	The allowed string length is 1 to 32, and the allowed content is the
	ASCII characters from 33 to 126.
	Indicates the security model that this entry should belong to. Possible
	security models are:
Coording Model	any: Accepted any security model (v1 v2c usm).
Security Model	v1: Reserved for SNMPv1.
	v2c: Reserved for SNMPv2c.
	usm: User-based Security Model (USM).
	Indicates the security model that this entry should belong to. Possible
	security models are:
Security Level	NoAuth, NoPriv: None authentication and none privacy.
	Auth, NoPriv: Authentication and none privacy.
	Auth, Priv: Authentication and privacy.
	The name of the MIB view defining the MIB objects for which this
Deed View News	request may request the current values. The allowed string length is
Read View Name	1 to 32, and the allowed content is the ASCII characters from 33 to
	126.
Write View Name	The name of the MIB view defining the MIB objects for which this
	request may potentially SET new values. The allowed string length is
	1 to 32, and the allowed content is the ASCII characters from 33 to
	126.
L	

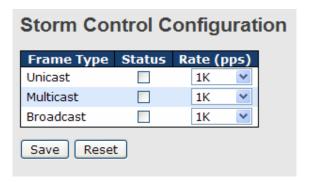

5.1.8 Traffic Prioritization5.1.8.1 Stom Control

There is a unicast storm rate control, multicast storm rate control, and a broadcast storm rate control. These only affect flooded frames, i.e. frames with a (VLAN ID, DMAC) pair not present on the MAC Address table.

The rate is 2ⁿ, where n is equal to or less than 15, or "No Limit". The unit of the rate can be either pps (packets per second) or kpps (kilopackets per second). The configuration indicates the permitted packet rate for unicast, multicast, or broadcast traffic across the switch.

Note: Frames, which are sent to the CPU of the switch are always limited to approximately 4 kpps. For example, broadcasts in the management VLAN are limited to this rate. The management VLAN is configured on the IP setup page.

Label	Description
Eromo Tyno	The settings in a particular row apply to the frame type listed here:
Frame Type	unicast, multicast, or broadcast.
Status	Enable or disable the storm control status for the given frame
	type.
	The rate unit is packet per second (pps), configure the rate as 1K,
Rate	2K, 4K, 8K, 16K, 32K, 64K, 128K, 256K, 512K, or 1024K.
	The 1 kpps is actually 1002.1 pps.

5.1.8.2 Port QoS

This page allows you to configure QoS settings for each port.

Frames can be classified by 4 different QoS classes: Low, Normal, Medium, and High.

The classification is controlled by a QCL that is assigned to each port.

A QCL consists of an ordered list of up to 12 QCEs.

Each QCE can be used to classify certain frames to a specific QoS class.

This classification can be based on parameters such as VLAN ID, UDP/TCP port, IPv4/IPv6 DSCP or Tag Priority.

Frames not matching any of the QCEs are classified to the default QoS class for the port.

Port QoS Configuration

Port QoS Configuration

Ingress Configuration					ion	Egress Configuration				
Port Default Class		OCL # Tag Priority		Tag Priority	Queuing Mode	Queue Weighted				
FUIL	Delault Clas	"	QCL	"	ray Friority	Queuing Mode	Low	Normal	Medium	High
1	Low	~	1	-	0 🕶	Strict Priority	1 ~	2 ٧	4 🗸	8 ~
2	Low	V	1 1	-	0 🕶	Strict Priority	1 ~	2 ~	4 ×	8 ~
3	Low	Y	1	-	0 🕶	Strict Priority	1 ~	2 4	4 💙	8 ~
4	Low	~	1 1	-	0 🕶	Strict Priority	1 ~	2 ~	4 ~	8 ~
5	Low	~	1	-	0 🕶	Strict Priority	1 ~	2 ~	4 🗸	8 ~
6	Low	~	1 1	-	0 🕶	Strict Priority 💌	1 ٧	2 ×	4 🗸	8 ~
7	Low	~	1	-	0 🕶	Strict Priority	1 ~	2 🗸	4 🗸	8 ~
8	Low	~	1	-	0 🕶	Strict Priority 💌	1 ×	2 ×	4 🗸	8 ~
9	Low	~	1	-	0 🕶	Strict Priority	1 ×	2 ~	4 🗸	8 ~
10	Low	~	1	-	0 🕶	Strict Priority 💌	1 ٧	2 ×	4 ×	8 ~
11	Low	~	1	-	0 🕶	Strict Priority	1 ~	2 🗸	4 ~	8 ~
12	Low	~	1 1	-	0 🕶	Strict Priority 💌	1 ~	2 🗸	4 🗸	8 ~

Label	Description
	A check box is provided for each port of a private VLAN.
Port	When checked, port isolation is enabled for that port.
Port	When unchecked, port isolation is disabled for that port.
	By default, port isolation is disabled for all ports.
Default Class	Configure the default QoS class for the port, that is, the QoS class
Delault Class	for frames not matching any of the QCEs in the QCL.
QCL#	Select which QCL to use for the port.
Tag Priority	Select the default tag priority for this port when adding a Tag to
lag Phonty	the untagged frames.
Queuing Mode	Select which Queuing mode for this port.
Ougus Weighted	Setting Queue weighted (Low=Normal, Medium=High) if the
Queue Weighted	"Queuing Mode" is "Weighted".

5.1.8.3 QoS Control List

This page lists the QCEs for a given QCL.

Frames can be classified by 4 different QoS classes: Low, Normal, Medium, and High.

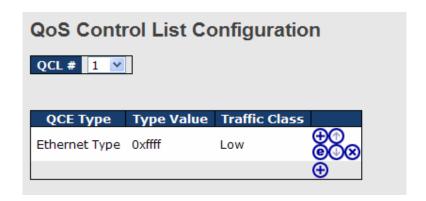

The classification is controlled by a QoS assigned to each port.

A QCL consists of an ordered list of up to 12 QCEs.

Each QCE can be used to classify certain frames to a specific QoS class.

This classification can be based on parameters such as VLAN ID, UDP/TCP port, IPv4/IPv6 DSCP or Tag Priority. Frames not matching any of the QCEs are classified to the default QoS Class for the port.

Label	Description
QCL#	Select a QCL to display a table that lists all the QCEs for that
QCL#	particular QCL.
	Specifies which frame field the QCE processes to determine the
	QoS class of the frame.
	The following QCE types are supported:
	Ethernet Type: The Ethernet Type field. If frame is tagged, this is
	the Ethernet Type that follows the tag header.
QCE Tyep	VLAN ID: VLAN ID. Only applicable if the frame is VLAN tagged.
QCE Tyep	TCP/UDP Port: IPv4 TCP/UDP source/destination port.
	DSCP: IPv4 and IPv6 DSCP.
	ToS: The 3 precedence bit in the ToS byte of the IPv4/IPv6 header
	(also known as DS field).
	Tag Priority: User Priority. Only applicable if the frame is VLAN
	tagged or priority tagged.
	Indicates the value according to its QCE type.
	Ethernet Type: The field shows the Ethernet Type value.
Type Value	VLAN ID: The field shows the VLAN ID.
	TCP/UDP Port: The field shows the TCP/UDP port range.
	DSCP: The field shows the IPv4/IPv6 DSCP value.
Traffic Class	The QoS class associated with the QCE.
Modification Buttons	You can modify each QCE in the table using the following buttons:
	Inserts a new QCE before the current row.

Edits the QCE.
: Moves the QCE up the list.
: Moves the QCE down the list.
: Deletes the QCE.
: The lowest plus sign adds a new entry at the bottom of the list of QCL.

5.1.8.4 Queuing Counters

This page provides statistics for the different queues for all switch ports.

Queuing Counters								
Auto-refresh Refresh Clear								
Port	Low	Queue	Norma	l Queue	Mediun	n Queue	High	Queue
POIL	Receive	Transmit	Receive	Transmit	Receive	Transmit	Receive	Transmit
	313	0	0	0	0	0	1	232
2	0	0	0	0	0	0	0	0
	4452	200516	0	0	0	0	0	3446
4	0	0	0	0	0	0	0	0
	200534	29	0	0	0	0	65	195

Label	Description
Port	The logical port for the settings contained in the same row.
Low Queue	There are 4 QoS queues per port with strict or weighted queuing
Low Queue	scheduling. This is the lowest priority queue.
Normal Queue	This is the normal priority queue of the 4 QoS queues. It has higher
Normai Queue	priority than the "Low Queue".
Medium Queue	This is the medium priority queue of the 4 QoS queues. It has higher
Mediani Queue	priority than the "Normal Queue".
High Queue This is the highest priority queue of the 4 QoS queues.	
Receive / Transmit	The number of received and transmitted packets per port.

5.1.8.5 Wizard

This handy wizard helps you set up a QCL quickly.

Welcome to the QCL Configuration Wizard!

Please select an action:

- Set up IP Cam High Performance Increase IP Cam performance.
- Set up Port Policies
 Group ports into several types according to different QCL policies.
- Set up Typical Network Application Rules
 Set up the specific QCL for different typical network application quality control.
- Set up ToS Precedence Mapping
 Set up the traffic class mapping to the precedence part of ToS (3 bits) when receiving IPv4/IPv6 packets.
- Set up VLAN Tag Priority Mapping
 Set up the traffic class mapping to the user priority value (3 bits) when receiving VLAN tagged packets.

To continue, click Next.

Next >

Label	Description
Set up Port Policies	Group ports into several types according to different QCL policies.
Set up Typical Network Application Rules	Set up the specific QCL for different typical network application quality control.
Set up ToS Precedence Mapping	Set up the traffic class mapping to the precedence part of ToS (3 bits) when receiving IPv4/IPv6 packets.
Set up VLAN Tag Priority Mapping	Set up the traffic class mapping to the User Priority value (3 bits) when receiving VLAN tagged packets.

5.1.9 Multicast

5.1.9.1 IGMP Snooping

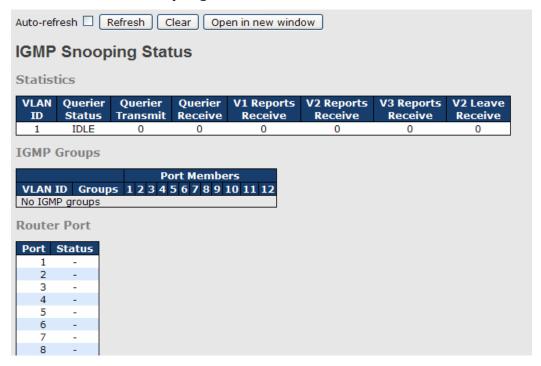

This page provides IGMP Snooping related configuration.

IGMP Snooping Configuration				
Global Configuration				
Snooping Enabled				
Unregistered IPMC Flooding enable	ed 🔲			
VLAN ID Snooping Enabled	IGMP Querier			
1				
Port Related Configuration				
Port Router Port Fast Leave	e			
1				
2 🗌				
3				
4 🗌				

Label	Description
Snooping Enabled	Enable the Global IGMP Snooping.
Unregistered	
IPMC Flooding	Enable unregistered IPMC traffic flooding.
enabled	
VLAN ID	The VLAN ID of the entry.
IGMP Snooping	Enable the per-VLAN IGMP Snooping.
Enabled	Chable the per-veat tolding Shooping.
	Enable the IGMP Querier in the VLAN. The Querier will send out if no
IGMP Querier	Querier received in 255 seconds after IGMP Querier Enabled. Each
IGIMP Querier	Querier's interval is 125 second, and it will stop act as an IGMP
	Querier if received any Querier from other devices.
	Specify which ports act as router ports. A router port is a port on the
	Ethernet switch that leads towards the Layer 3 multicast device or
Router Port	IGMP querier.
	If an aggregation member port is selected as a router port, the whole
	aggregation will act as a router port.
Fast Leave	Enable the fast leave on the port.

5.1.9.2 IGMP Snooping Status

Label	Description		
VLAN ID	The VLAN ID of the entry.		
Groups	The present IGMP groups. Max. are 128 groups for each VLAN.		
Port Members	The ports that are members of the entry.		
Querier Status	Show the Querier status is "ACTIVE" or "IDLE".		
Querier Receive	The number of Transmitted Querier.		
V1 Reports	The number of Passived V1 Paparts		
Receive	The number of Received V1 Reports.		
V2 Reports	The number of Received V2 Reports.		
Receive			
V3 Reports	The number of Received V3 Reports.		
Receive			
V2 Leave Receive	The number of Received V2 Leave.		
Refresh	Click to refresh the page immediately.		
Clear	Clears all Statistics counters.		
Auto-refresh	Check this box to enable an automatic refresh of the page at regular		
Auto-refresh 🔲	intervals.		

5.1.10 Security

5.1.10.1 Remote Control Security Configuration

Remote Control Security allows you limit the remote access of management interface. When enabled, the request of client which is not in the allow list will be rejected.

Label	Description
Port	Port number of remote client.
IP Address	IP address of remote client. Keeps this field "0.0.0.0" means "Any
IP Address	IP".
Web	Check this item to enable Web management interface.
Telnet Check this item to enable Telnet management interface.	
SNMP	Check this item to enable SNMP management interface
Delete	Check this item to delete.

5.1.10.2 Device Binding

This page provides Device Binding related configuration. Device Binding is an powerful monitor for devices and network security.

Label	Description	
	Indicates the per-port Device Binding operation. Possible modes are:	
	: Disable.	
Mode	Scan: Scan IP/MAC automatically, but no binding function.	
Mode	Binding: Enable binding function. Under this mode, any IP/MAC	
	doesn't match the entry will not be allowed to access the network.	
	Shutdown: Shutdown the port (No Link).	
Alive Check Enable/Disable Alive Check. When enabled, switch will		
Active	device continually.	
	Indicates the Alive Check status. Possible statuses are:	
	: Disable.	
Alive Check Satus	Got Reply: Got ping reply from device, that means the device is still	
	alive.	
	Lost Reply: Lost ping reply from device, that means the device might	
	have been hanged.	
Stream Check	Enable/Disable Stream Check. When enabled, switch will detect the	
Active	stream change(getting low) from device.	
	Indicates the Stream Check status. Possible statuses are:	
Stream Check	: Disable.	
Status	Normal: The stream is normal.	
	Low: The stream is getting low.	
DDoS Prevention	Enable/Disable DDOS Prevention. When enabled, switch will monitor	
Acton	the device to against DDOS attack (from device).	
	Indicates the DDOS Prevention status. Possible statuses are:	
DDoS Prevention	: Disable.	
Status	Analysing: Analyse the packet throughput for initialization.	
Status	Running: Function ready.	
	Attacked: DDOS attack happened.	
Device IP Address	Specify the IP Address of device.	
Device MAC	Specify the MAC Address of device.	
Address	openity the Mino Address of device.	

4.1.10.2.1 Advanced Configuration

Alias IP Address

This page provides Alias IP Address related configuration. Some device might have more IP addresses than one, you could specify the other IP address here.

Port	 Alias IP Address
1	0.0.0.0
2	0.0.0.0
3	0.0.0.0
4	0.0.0.0
5	0.0.0.0
6	0.0.0.0
7	0.0.0.0
8	0.0.0.0
9	0.0.0.0
10	0.0.0.0
11	0.0.0.0
12	0.0.0.0

Label	Description
Alias IP Address	Specify Alias IP address. Keeps "0.0.0.0", if the device doesn't have
	alias IP address.

Alive Check

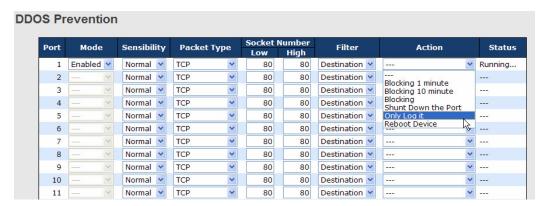

using the ping command ,check port link status, if port link fail .user can setting action field , select the switch action.

Label	Description	
Link Change	Disable and enable port .	
Only log it	Only sent log to log server .	
Shunt Down the	Disable this port .	
Port	Disable this port.	
Reboot Device	Disable and Enable P.O.E Power ,	

DDoS Prevention

This page provides DDOS Prevention related configuration. Switch could monitor the ingress packets, and do some actions when DDOS attack happened on this port. Configure these setting helps the prevention become more suitable.

Label	Description
Mode	Enable/Disable DDOS Prevention of the port.
	Indicates the level of DDOS detection. Possible levels are:
	Low: Low sensibility.
Sensibility	Normal: Normal sensibility.
	Medium: Medium sensibility.
	High: High sensibility.
	Indicates the packet type of DDOS monitor. Possible types are:
	RX Total: Total ingress packets.
	RX Unicast: Unicast ingress packets.
Packet Type	RX Multicast: Multicast ingress packets.
	RX Broadcast: Broadcast ingress packets.
	TCP: TCP ingress packets.
	UDP: UDP ingress packets.
	If packet type is UDP(or TCP), please specify the socket number
Socket Number	here. The socket number could be a range, from low to high. If the
Socket Number	socket number is only one, please fill the same number in low field
	and high field.
Filiter	If packet type is UDP(or TCP), please choose the socket direction
Time	(Destination/Source).
	Indicates the action when DDOS attack happened. Possible actions
	are:
	: Do nothing.
	Blocking 1 minute: To block the forwarding for 1 mintue, and log the
	event.
Action	Blocking 10 minute: To block the forwarding for 10 minutes, and log
Addion	the event.
	Blocking: Just blocking, and log the event.
	Shunt Down the Port: Shut down the port(No Link), and log the event.
	Only Log it: Just log the event.
	Reboot Device: If POE supported, the device could be rebooted. And
	log the event.
	Indicates the DDOS Prevention status. Possible statuses are:
	: Disable.
Status	Analysing: Analyse the packet throughput for initialization.
	Running: Function ready.
	Attacked: DDOS attack happened.

Device Description

Mode	Enable/Disable stream monitor of the port.
	Indicates the action when stream getting low. Possible actions are:
Action	: Do nothing.
	Log it: Just log the event

5.1.10.3 ACL 5.1.10.3.1 Ports

Configure the ACL parameters (ACE) of each switch port. These parameters will affect frames received on a port unless the frame matches a specific ACE.

Label	Description
Port	The logical port for the settings contained in the same row.
Policy ID	Select the policy to apply to this port. The allowed values are 1
Policy ID	through 8. The default value is 1.
Action	Select whether forwarding is permitted ("Permit") or denied ("Deny").
Action	The default value is "Permit".
Rate Limiter ID	Select which rate limiter to apply to this port. The allowed values are
hate Limiter iD	Disabled or the values 1 through 15. The default value is "Disabled".
Port Copy	Select which port frames are copied to. The allowed values are
Роп Сору	Disabled or a specific port number. The default value is "Disabled".
	Specify the logging operation of this port. The allowed values are:
	Enabled: Frames received on the port are stored in the System Log.
Logging	Disabled: Frames received on the port are not logged.
	The default value is "Disabled". Please note that the System Log
	memory size and logging rate is limited.
	Specify the port shut down operation of this port. The allowed values
	are:
Shutdown	Enabled: If a frame is received on the port, the port will be disabled.
	Disabled: Port shut down is disabled.
	The default value is "Disabled".
Counter	Counts the number of frames that match this ACE.

5.1.10.3.2 Rate Limiters

Configure the rate limiter for the ACL of the switch.

Label	Description
Rate Limiter ID	The rate limiter ID for the settings contained in the same row.
Rate	The rate unit is packet per second (pps), configure the rate as 1, 2, 4,
	8, 16, 32, 64, 128, 256, 512, 1K, 2K, 4K, 8K, 16K, 32K, 64K, 128K,
	256K, 512K, or 1024K.
	The 1 kpps is actually 1002.1 pps.

5.1.10.3.3 ACL Configuration

Configure an ACE (Access Control Entry) on this page.

An ACE consists of several parameters. These parameters vary according to the frame type that you select. First select the ingress port for the ACE, and then select the frame type. Different parameter options are displayed depending on the frame type that you selected.

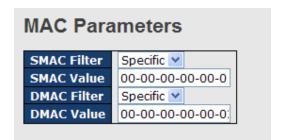

A frame that hits this ACE matches the configuration that is defined here.

Label	Description
	Select the ingress port for which this ACE applies.
	Any: The ACE applies to any port.
Ingress Port	Port n: The ACE applies to this port number, where n is the number
iligiess Port	of the switch port.
	Policy n: The ACE applies to this policy number, where n can range
	from 1 through 8.
	Select the frame type for this ACE. These frame types are mutually
	exclusive.
Frame Type	Any: Any frame can match this ACE.
	Ethernet Type: Only Ethernet Type frames can match this ACE. The
	IEEE 802.3 descripts the value of Length/Type Field specifications

	should be greater than or equal to 1536 decimal (equal to 0600
	hexadecimal).
	ARP: Only ARP frames can match this ACE. Notice the ARP frames
	won't match the ACE with etnernet type.
	IPv4: Only IPv4 frames can match this ACE. Notice the IPv4 frames
	won't match the ACE with etnernet type.
	Specify the action to take with a frame that hits this ACE.
Action	Permit: The frame that hits this ACE is granted permission for the
Action	ACE operation.
	Deny: The frame that hits this ACE is dropped.
Data Limitan	Specify the rate limiter in number of base units. The allowed range is
Rate Limiter	1 to 15. Disabled indicates that the rate limiter operation is disabled.
	Frames that hit the ACE are copied to the port number specified
Port Copy	here. The allowed range is the same as the switch port number
	range. Disabled indicates that the port copy operation is disabled.
	Specify the logging operation of the ACE. The allowed values are:
	Enabled: Frames matching the ACE are stored in the System Log.
Logging	Disabled: Frames matching the ACE are not logged.
	Please note that the System Log memory size and logging rate is
	limited.
	Specify the port shut down operation of the ACE. The allowed values
	are:
Shutdown	Enabled: If a frame matches the ACE, the ingress port will be
	disabled.
	Disabled: Port shut down is disabled for the ACE.
_	The counter indicates the number of times the ACE was hit by a
Counter	frame.

Label	Description
	(Only displayed when the frame type is Ethernet Type or ARP.)
	Specify the source MAC filter for this ACE.
SMAC Filter	Any: No SMAC filter is specified. (SMAC filter status is "don't-care".)
	Specific: If you want to filter a specific source MAC address with this
	ACE, choose this value. A field for entering an SMAC value appears.
	When "Specific" is selected for the SMAC filter, you can enter a
SMAC Value	specific source MAC address. The legal format is
SIMAC Value	"xx-xx-xx-xx-xx". A frame that hits this ACE matches this SMAC
	value.
	Specify the destination MAC filter for this ACE.
	Any: No DMAC filter is specified. (DMAC filter status is "don't-care".)
	MC: Frame must be multicast.
DMAC Filter	BC: Frame must be broadcast.
DWAC FILE	UC: Frame must be unicast.
	Specific: If you want to filter a specific destination MAC address with
	this ACE, choose this value. A field for entering a DMAC value
	appears.
	When "Specific" is selected for the DMAC filter, you can enter a
DMAC Value	specific destination MAC address. The legal format is
DIVIAC Value	"xx-xx-xx-xx-xx". A frame that hits this ACE matches this DMAC
	value.

Label	Description
	Specify the VLAN ID filter for this ACE.
	Any: No VLAN ID filter is specified. (VLAN ID filter status is
VLAN ID Filter	"don't-care".)
	Specific: If you want to filter a specific VLAN ID with this ACE, choose
	this value. A field for entering a VLAN ID number appears.

	When "Specific" is selected for the VLAN ID filter, you can enter a
VLAN ID	specific VLAN ID number. The allowed range is 1 to 4095. A frame
	that hits this ACE matches this VLAN ID value.
	Specify the tag priority for this ACE. A frame that hits this ACE
Tog Driority	matches this tag priority. The allowed number range is 0 to 7. The
Tag Priority	value Any means that no tag priority is specified (tag priority is
	"don't-care".)

IP Parameters IP Protocol Filter Other 💌 IP Protocol Value 6 **IP TTL** Non-zero 💌 **IP Fragment** Yes 💌 **IP Option** Yes 💌 Network 💌 SIP Filter SIP Address 0.0.0.0 SIP Mask 0.0.0.0 **DIP Filter** Network 💌 **DIP Address** 0.0.0.0 **DIP Mask** 0.0.0.0

Label	Description
	Specify the IP protocol filter for this ACE.
	Any: No IP protocol filter is specified ("don't-care").
	Specific: If you want to filter a specific IP protocol filter with this ACE,
	choose this value. A field for entering an IP protocol filter appears.
	ICMP: Select ICMP to filter IPv4 ICMP protocol frames. Extra fields
	for defining ICMP parameters will appear. These fields are explained
IP Protocol Filter	later in this help file.
	UDP: Select UDP to filter IPv4 UDP protocol frames. Extra fields for
	defining UDP parameters will appear. These fields are explained later
	in this help file.
	TCP: Select TCP to filter IPv4 TCP protocol frames. Extra fields for
	defining TCP parameters will appear. These fields are explained later
	in this help file.
	When "Specific" is selected for the IP protocol value, you can enter a
IP Protocol Value	specific value The allowed range is 0 to 255. A frame that hits this
	ACE matches this IP protocol value.

	Specify the Time-to-Live settings for this ACE.			
	zero: IPv4 frames with a Time-to-Live field greater than zero must not			
IP TTL	be able to match this entry.			
	non-zero: IPv4 frames with a Time-to-Live field greater than zero			
	must be able to match this entry.			
	Any: Any value is allowed ("don't-care").			
	Specify the fragment offset settings for this ACE. This involves the			
	settings for the More Fragments (MF) bit and the Fragment Offset			
	(FRAG OFFSET) field for an IPv4 frame.			
	No: IPv4 frames where the MF bit is set or the FRAG OFFSET field is			
IP Fragment	greater than zero must not be able to match this entry.			
	Yes: IPv4 frames where the MF bit is set or the FRAG OFFSET field			
	is greater than zero must be able to match this entry.			
	Any: Any value is allowed ("don't-care").			
	Specify the options flag setting for this ACE.			
	No: IPv4 frames where the options flag is set must not be able to			
	match this entry.			
IP Option	Yes: IPv4 frames where the options flag is set must be able to match			
	this entry.			
	Any: Any value is allowed ("don't-care").			
	Specify the source IP filter for this ACE.			
	Any: No source IP filter is specified. (Source IP filter is "don't-care".)			
	Host: Source IP filter is set to Host. Specify the source IP address in			
SIP Filter	the SIP Address field that appears.			
	Network: Source IP filter is set to Network. Specify the source IP			
	address and source IP mask in the SIP Address and SIP Mask fields			
	that appear.			
	When "Host" or "Network" is selected for the source IP filter, you can			
SIP Address	enter a specific SIP address in dotted decimal notation.			
	When "Network" is selected for the source IP filter, you can enter a			
SIP Mask	specific SIP mask in dotted decimal notation.			
	Specify the destination IP filter for this ACE.			
	Any: No destination IP filter is specified. (Destination IP filter is			
	"don't-care".)			
DIP Filter	Host: Destination IP filter is set to Host. Specify the destination IP			
	address in the DIP Address field that appears.			
	Network: Destination IP filter is set to Network. Specify the			

	destination IP address and destination IP mask in the DIP Address			
and DIP Mask fields that appear.				
DIP Address	When "Host" or "Network" is selected for the destination IP filter, you			
	can enter a specific DIP address in dotted decimal notation.			
DIP Mask	When "Network" is selected for the destination IP filter, you can enter			
	a specific DIP mask in dotted decimal notation.

5.1.10.3.4 Wizard

This handy wizard helps you set up an ACL quickly

Welcome to the ACL Configuration Wizard!

Please select an action:

- Set up Policy Rules
 Set up the default policy rules for Client ports, Server ports, Network ports, and Guest ports.
- Set up Port Policies
 Group ports into several types according to different ACL policies.
- Set up Typical Network Application Rules
 Set up the specific ACL for different typical network application access control.
- Set up Source MAC and Source IP Binding
 Strictly control the network traffic by only allowing incoming frames that match the source MAC and source IP on specific ports.
- Set up DoS Attack Defense Rules
 Set up the specific ACL to defend DoS attack.

To continue, click Next.

Next

Set up Typical Network Application Rules	Set up the specific ACL for different typical network application access control.			
Set up Source MAC and Source IP Binding	Strictly control the network traffic by only allowing incoming frames that match the source IP and source MAC on specific port.			
Set up Dos Attack Defense Rules	Set up the specific ACL to defend DoS attack.			

5.1.10.4 802.1x

This page allows you to configure the IEEE 802.1X and MAC-based authentication system and port settings.

The IEEE 802.1X standard defines a port-based access control procedure that prevents unauthorized access to a network by requiring users to first submit credentials for authentication. One or more central servers, the backend servers, determine whether the user is allowed access to the network. These backend (RADIUS) servers are configured on the Authentication configuration page.

MAC-based authentication allows for authentication of more than one user on the same port, and doesn't require the user to have special 802.1X software installed on his system. The switch uses the user's MAC address to authenticate against the backend server. Intruders can create counterfeit MAC addresses, which makes MAC-based authentication less secure than 802.1X authentication.

Overview of 802.1X (Port-Based) Authentication

In the 802.1X-world, the user is called the supplicant, the switch is the authenticator, and the RADIUS server is the authentication server. The switch acts as the man-in-the-middle, forwarding requests and responses between the supplicant and the authentication server. Frames sent between the supplicant and the switch are special 802.1X frames, known as EAPOL (EAP Over LANs) frames. EAPOL frames encapsulate EAP PDUs (RFC3748). Frames sent between the switch and the RADIUS server are RADIUS packets. RADIUS packets also encapsulate EAP PDUs together with other attributes like the switch's IP address, name, and the supplicant's port number on the switch. EAP is very flexible, in that it allows for different authentication methods, like MD5-Challenge, PEAP, and TLS. The important thing is that the authenticator (the switch) doesn't need to know which authentication method the supplicant and the authentication server are using, or how many information exchange frames are needed for a particular method. The switch simply encapsulates the EAP part of the frame into the relevant type (EAPOL or RADIUS) and forwards it.

When authentication is complete, the RADIUS server sends a special packet containing a success or failure indication. Besides forwarding this decision to the supplicant, the switch uses it to open up or block traffic on the switch port connected to the supplicant.

Note: Suppose two backend servers are enabled and that the server timeout is configured to X seconds (using the Authentication configuration page), and suppose that the first server in the list is currently down (but not considered dead). Now, if the supplicant retransmits EAPOL Start

frames at a rate faster than X seconds, then it will never get authenticated, because the switch will cancel on-going backend authentication server requests whenever it receives a new EAPOL Start frame from the supplicant. And since the server hasn't yet failed (because the X seconds haven't expired), the same server will be contacted upon the next backend authentication server request from the switch. This scenario will loop forever. Therefore, the server timeout should be smaller than the supplicant's EAPOL Start frame retransmission rate.

Overview of MAC-Based Authentication

Unlike 802.1X, MAC-based authentication is not a standard, but merely a best-practices method adopted by the industry. In MAC-based authentication, users are called clients, and the switch acts as the supplicant on behalf of clients. The initial frame (any kind of frame) sent by a client is snooped by the switch, which in turn uses the client's MAC address as both username and password in the subsequent EAP exchange with the RADIUS server. The 6-byte MAC address is converted to a string on the following form "xx-xx-xx-xx-xx-xx", that is, a dash (-) is used as separator between the lower-cased hexadecimal digits. The switch only supports the MD5-Challenge authentication method, so the RADIUS server must be configured accordingly.

When authentication is complete, the RADIUS server sends a success or failure indication, which in turn causes the switch to open up or block traffic for that particular client, using static entries into the MAC Table. Only then will frames from the client be forwarded on the switch. There are no EAPOL frames involved in this authentication, and therefore, MAC-based Authentication has nothing to do with the 802.1X standard.

The advantage of MAC-based authentication over 802.1X is that several clients can be connected to the same port (e.g. through a 3rd party switch or a hub) and still require individual authentication, and that the clients don't need special supplicant software to authenticate. The disadvantage is that MAC addresses can be spoofed by malicious users, equipment whose MAC address is a valid RADIUS user can be used by anyone, and only the MD5-Challenge method is supported.

The 802.1X and MAC-Based Authentication configuration consists of two sections, a systemand a port-wide

	by the Reauthentication Period. Reauthentication for						
	802.1X-enabled ports can be used to detect if a new device is						
Reauthentication	plugged into a switch port.						
Enabled	For MAC-based ports, reauthentication is only useful if the						
Enabled	RADIUS server configuration has changed. It does not involve						
	communication between the switch and the client, and therefore						
	doesn't imply that a client is still present on a port (see Age Period						
	below).						
	Determines the period, in seconds, after which a connected clie						
Reauthentication	must be reauthenticated. This is only active if the						
Period	Reauthentication Enabled checkbox is checked. Valid values are						
	in the range 1 to 3600 seconds.						
	Determines the time the switch shall wait for the supplicant						
EAP Timeout	response before retransmitting a packet. Valid values are in the						
	range 1 to 255 seconds. This has no effect for MAC-based ports.						
Age Period	This setting applies to ports running MAC-based authentication,						

	only.
	Suppose a client is connected to a 3rd party switch or hub, which
	in turn is connected to a port on this switch that runs MAC-based
	authentication, and suppose the client gets successfully
	authenticated. Now assume that the client powers down his PC.
	What should make the switch forget about the authenticated
	client? Reauthentication will not solve this problem, since this
	doesn't require the client to be present, as discussed under
	Reauthentication Enabled above. The solution is aging of
	authenticated clients. The Age Period, which can be set to a
	number between 10 and 1000000 seconds, works like this: A
	timer is started when the client gets authenticated. After half the
	age period, the switch starts looking for frames sent by the client.
	If another half age period elapses and no frames are seen, the
	client is considered removed from the system, and it will have to
	authenticate again the next time a frame is seen from it. If, on the
	other hand, the client transmits a frame before the second half of
	the age period expires, the switch will consider the client alive,
	and leave it authenticated. Therefore, an age period of T will
	require the client to send frames more frequent than T/2 for him to
	stay authenticated.
	This setting applies to ports running MAC-based authentication,
	only.
	If the RADIUS server denies a client access, or a RADIUS server
	request times out (according to the timeout specified on the
Hold Time	Authentication configuration page), the client is put on hold in the
noia iiiile	Unauthorized state. In this state, frames from the client will not
	cause the switch to attempt to reauthenticate the client. The Hold
	Time, which can be set to a number between 10 and 1000000
	seconds, determines the time after an EAP Failure indication or
	RADIUS timeout that a client is not allowed access.
Port	The port number for which the configuration below applies.
	Sets the authentication mode to one of the following options (only
	used when 802.1X or MAC-based authentication is globally
Admin State	enabled):
	Auto: Requires an 802.1X-aware client (supplicant) to be
	authorized by the authentication server. Clients that are not

	802.1X-aware will be denied access.				
	Authorized: Forces the port to grant access to all clients,				
	802.1X-aware or not. The switch transmits an EAPOL Success				
	frame when the port links up.				
	Unauthorized: Forces the port to deny access to all clients,				
	802.1X-aware or not. The switch transmits an EAPOL Failure				
	frame when the port links up.				
	MAC-Based: Enables MAC-based authentication on the port.				
	The switch doesn't transmit or accept EAPOL frames on the port.				
	Flooded frames and broadcast traffic will be transmitted on the				
	port, whether or not clients are authenticated on the port, whereas				
	unicast traffic against an unsuccessfully authenticated client will				
	be dropped. Clients that are not (yet) successfully authenticated				
	will not be allowed to transmit frames of any kind.				
	The current state of the port. It can undertake one of the following				
	values:				
	Disabled: 802.1X and MAC-based authentication is globally				
	disabled.				
	Link Down: 802.1X or MAC-based authentication is enabled, but				
	there is no link on the port.				
	Authorized: The port is authorized. This is the case when 802.1X				
	authentication is enabled, the port has link, and the Admin State is				
Port State	"Auto" and the supplicant is authenticated or the Admin State is				
1 ort otate	"Authorized".				
	Unauthorized: The port is unauthorized. This is the case when				
	802.1X authentication is enabled, the port has link, and the Admin				
	State is "Auto", but the supplicant is not (yet) authenticated or the				
	Admin State is "Unauthorized".				
	X Auth/Y Unauth: X clients are currently authorized and Y are				
	unauthorized. This state is shown when 802.1X and MAC-based				
	authentication is globally enabled and the Admin State is set to				
	"MAC-Based".				
	This setting applies to ports running MAC-based authentication,				
	only.				
Max Clients	The maximum number of clients allowed on a given port can be				
	configured through the list-box and edit-control for this setting.				
	Choosing the value "All" from the list-box allows the port to				

consume up to 48 client state-machines. Choosing the value "Specific" from the list-box opens up for entering a specific number of maximum clients on the port (1 to 48). The switch is "born" with a pool of state-machines, from which all ports draw whenever a new client is seen on the port. When a given port's maximum is reached (both authorized and unauthorized clients count), further new clients are disallowed access. Since all ports draw from the same pool, it may happen that a configured maximum cannot be granted, if the remaining ports have already used all available state-machines. Two buttons are available for each row. The buttons are only enabled when authentication is globally enabled and the port's Admin State is "Auto" or "MAC-Based". Clicking these buttons will not cause settings changed on the page to take effect. Reauthenticate: Schedules a reauthentication to whenever the quiet-period of the port runs out (port-based authentication). For Restart MAC-based authentication, reauthentication will be attempted immediately. The button only has effect for successfully authenticated ports/clients and will not cause the port/client to get temporarily unauthorized. Reinitialize: Forces a reinitialization of the port/clients and thereby a reauthentication immediately. The port/clients will transfer to the unauthorized state while the reauthentication is ongoing.

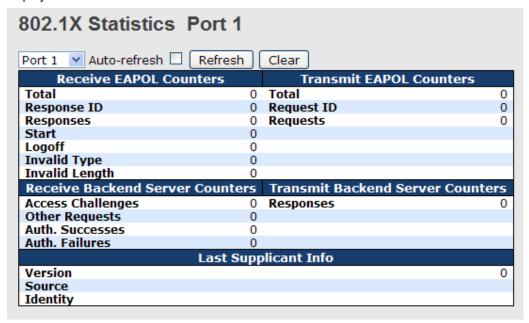

Label	Description					
Dort	The switch port number. Click to navigate to detailed 802.1X					
Port	statistics for this port.					
State	The current state of the port. Refer to IEEE 802.1X Port State for					
State	a description of the individual states.					
	The source MAC address carried in the most recently received					
Last Source	EAPOL frame for port-based authentication, and the most					
Last Source	recently received frame from a new client for MAC-based					
	authentication.					
	The user name (supplicant identity) carried in the most recently					
Last ID	received Resp/ID EAPOL frame for port-based authentication,					
Last ID	and the source MAC address from the most recently received					
	frame from a new client for MAC-based authentication.					

This page provides detailed IEEE 802.1X statistics for a specific switch port running port-based authentication. For MAC-based ports, it shows selected backend server (RADIUS Authentication Server) statistics, only. Use the port select box to select which port details to be displayed.

Label	Description								
	These counters are not available for MAC-based ports.								
	Supplicant frame counter statistics. There are seven receive frame								
	counters and three transmit frame counters.								
	EAPOL Counters								
	Direction	n Name	IEEE Name	Description					
	Rx	Total	dot1xAuthEapolFramesRx	The number of valid EAPOL frames of any type that have been received by the switch.					
	Rx	Response ID	dot1xAuthEapolRespIdFramesRx	The number of valid EAP Resp/ID frames that have been received by the switch.					
EAPOL Counters	Rx Responses		dot1xAuthEapolRespFramesRx	The number of valid EAPOL response frames (other than Resp/ID frames) that have been received by the switch.					
L/ II OL OGGINGIO	Rx	Rx Start dot1xAuthEapolStartFramesRx		The number of EAPOL Start frames that have been received by the switch.					
	Rx	Logoff	dot1xAuthEapolLogoffFramesRx	The number of valid EAPOL logoff frames that have been received by the switch.					
	Rx	Invalid Type	dot1xAuthInvalidEapolFramesRx	The number of EAPOL frames that have been received by the switch in which the frame type is not recognized.					
	Rx	Invalid Length	dot1xAuthEapLengthErrorFramesR	The number of EAPOL frames that have x been received by the switch in which the Packet Body Length field is invalid.					
	Tx	Total	dot1xAuthEapolFramesTx	The number of EAPOL frames of any type that have been transmitted by the switch.					
	Tx	Request ID	dot1xAuthEapolReqIdFramesTx	The number of EAP initial request frames that have been transmitted by the switch.					
	Tx	Requests	dot1xAuthEapolReqFramesTx	The number of valid EAP Request frames (other than initial request frames) that have been transmitted by the switch.					
	Backer	nd server fra	ame counter statistics.						
Backend Server	- non-triangle control of the contro								
Counters									
counters on this port. The right-most shows backend server count									

for the currently selected client, or dashes if no client is selected or available. A client can be selected from the list of authorized/unauthorized clients below the two counter tables.

There are slight differences in the interpretation of the counters between port- and MAC-based authentication as shown below.

		Backend Server Counters	
Direction	Name	IEEE Name	Description
Rx	Access Challenges	dot1xAuthBackendAccessChallenges	Port-based: Counts the number of times that the switch receives the first request from the backend server following the first response from the supplicant. Indicate that the backend server has communication with the switch. MAC-based: Counts all Access Challenges received from the backend server for this port (left-most table) or client (right-most table).
Rx	Other Requests	dot1xAuthBackendOtherRequestsToSupplicant	Port-based: Counts the number of times that the switch sends an EAP Request packet following the first to the supplicant. Indicates that the backend server chose an EAP-method. MAC-based: Not applicable.
Rx	Auth. Successes	dot1xAuthBackendAuthSuccesses	Port- and MAC-based: Counts the number of times that the switch receives a success indication. Indicates that the supplicant/client has successfully authenticated to the backend server.
Rx	Auth. Failures	dot1xAuthBackendAuthFails	Port- and MAC-based: Counts the number of times that the switch receives a failure message. This indicates that the supplicant/client has not authenticated to the backend server.
Tx	Responses	dot1xAuthBackendResponses	Port-based: Counts the number of times that the switch attempts to send a supplicant's first response packet to the backend server. Indicates the switch attempter communication with the backend server. Possible retransmissions are not counted. MAC-based: Counts all the backend server packets sent from the switch towards the backend server for a given port (leftmost table) Possible retransmissions are not counted.

For MAC-based ports, this section is embedded in the backend server counter's section.

Information about the last supplicant/client that attempted to authenticate.

Last Supplicant/Client Info

	Last Supplicant/Client Info						
Name	IEEE Name	Description					
Version	dot1xAuthLastEapolFrameVersion	Port-based: The protocol version number carried in the most recently received EAPOL frame. MAC-based: Not applicable.					
Source	dot1xAuthLastEapolFrameSource	Port-based: The source MAC address carried in the most recently received EAPOL frame. MAC-based: Not applicable.					
Identity or (Last) Client	-	Port-based: The user name (supplicant identity) carried in the most recently received Resp/ID EAPOL frame. MAC-based: The MAC address of the last client that attempted to authenticate (left-most table), or the MAC address of the currently selected client (right-most table).					

Clients attached to this port

This table is only available for MAC-based ports

Each row in the table represents a MAC-based client on the port, and there are three parameters for each client:

MAC Address:

Shows the MAC address of the client, which is also used as the

password in the authentication process against the backend server. Clicking the link causes the client's backend server counters to be shown in the right-most backend server counters table above. If no clients are attached, it shows No clients attached.

State:

Shows whether the client is authorized or unauthorized. As long as the backend server hasn't successfully authenticated a client, it is unauthorized.

Last Authentication:

Show the date and time of the last authentication of the client. This gets updated for every re-authentication of the client.

Client Configuration

The table has one row for each Client and a number of columns, which are:

Label	Description				
Client	The Client for which the configuration below applies.				
Authentication	Authentication Method can be set to one of the following values:				
Metohd	none: authentication is disabled and login is not possible.				
	local: use the local user database on the switch stack for				
	authentication.				
	radius : use a remote RADIUS server for authentication.				
	tacacs+: use a remote TACACS+ server for authentication.				
Fallback	Enable fallback to local authentication by checking this box.				
	If none of the configured authentication servers are alive, the local				
	user database is used for authentication.				
	This is only possible if the Authentication Method is set to				
	something else than 'none or 'local'.				
Save	Click to save changes.				
Reset	Click to undo any changes made locally and revert to previously				
	saved values.				

RADIUS Authentication Server Configuration

The table has one row for each RADIUS Authentication Server and a number of columns, which are:

Label	Description					
#	The RADIUS Authentication Server number for which the					
	configuration below applies.					
Enable	Enable the RADIUS Authentication Server by checking this box.					
IP Address	Enable fallback to local authentication by checking this box.					
	If none of the configured authentication servers are alive, the local					
	user database is used for authentication.					
	This is only possible if the Authentication Method is set to					
	something else than 'none or 'local'.					

RADIUS Authentication Server Status Overview

	Ready: The server is enabled, IP communication is up and				
Ctoto	running, and the RADIUS module is ready to accept accounting				
State	attempts.				
	Dead (X seconds left): Accounting attempts were made to this				
	server, but it did not reply within the configured timeout. The				
	server has temporarily been disabled, but will get re-enabled				
	when the dead-time expires. The number of seconds left before				
	this occurs is displayed in parentheses. This state is only				
	reachable when more than one server is enabled.				

The statistics map closely to those specified in RFC4668 - RADIUS Authentication Client MIB. Use the server select box to switch between the backend servers to show details for.

Label	Description
Packet Counters	RADIUS authentication server packet counter. There are seven receive
Facket Counters	and four transmit counters.

	Directio	n Name	RFC4668 Name	Description
	Rx			The number of RADIUS Access-Accept packets
	Rx	Access Accepts Access Rejects	radiusAuthClientExtAccessAccepts radiusAuthClientExtAccessRejects	(valid or invalid) received from the server. The number of RADIUS Access-Reject packets
	Rx	Access Challenges	radiusAuthClientExtAccessChallenges	(valid or invalid) received from the server. The number of RADIUS Access-Challenge packets (valid or invalid) received from the server.
	Rx	Malformed Access Responses	radiusAuthClientExtMalformedAccessResponse	The number of malformed RADIUS Access- Response packets received from the server. Malformed packets include packets with an ²⁵ invalid length. Bad authenticators or Message Authenticator attributes or unknown types are not included as malformed access responses.
	Rx	Bad Authenticators	radiusAuthClientExtBadAuthenticators	The number of RADIUS Access-Response packets containing invalid authenticators or Message Authenticator attributes received from the server.
	Rx	Unknown Types	radiusAuthClientExtUnknownTypes	The number of RADIUS packets that were received from the server on the authentication port and dropped for some other reason.
	Rx	Packets Dropped	radiusAuthClientExtPacketsDropped	The number of RADIUS packets that were received from the server on the authentication port and dropped for some other reason.
	Tx	Access Requests	radiusAuthClientExtAccessRequests	The number of RADIUS Access-Request packets sent to the server. This does not include retransmissions.
	Tx	Access Retransmissions	radiusAuthClientExtAccessRetransmissions	The number of RADIUS Access-Request packets retransmitted to the RADIUS authentication server.
	Тх	Pending Requests	radiusAuthClientExtPendingRequests	The number of RADIUS Access-Request packets destined for the server that have not yet timed out or received a response. This variable is incremented when an Access-Request is sent and decremented due to receipt of an Access-Accept, Access-Reject, Access-Challenge, timeout, or retransmission.
	Tx	Timeouts	radiusAuthClientExtTimeouts	The number of authentication timeouts to the server. After a timeout, the client may retry to the same server, send to a different server, or give up. A retry to the same server is counted as a retransmit as well as a timeout. A send to a different server is counted as a Request as well as a timeout.

5.1.11 Warning **5.1.11.1 Fault Alarm**

When any selected fault event is happened, the Fault LED in switch panel will light up and the electric relay will signal at the same time.

5.1.11.2 System Warning 5.1.11.2.1 SYSLOG Setting

The SYSLOG is a protocol to transmit event notification messages across networks.

Please refer to RFC 3164 - The BSD SYSLOG Protocol

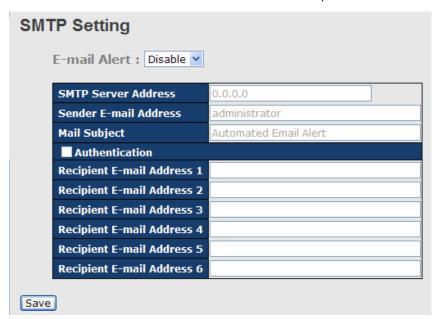

System Warning - SYSLOG Setting interface

The following table describes the labels in this screen.

Label	Description
SYSLOG Server IP Address	The remote SYSLOG Server IP address.

5.1.11.2.2 SMTP Setting

The SMTP is Short for Simple Mail Transfer Protocol. It is a protocol for e-mail transmission across the Internet. Please refer to RFC 821 - Simple Mail Transfer Protocol.

System Warning - SMTP Setting interface

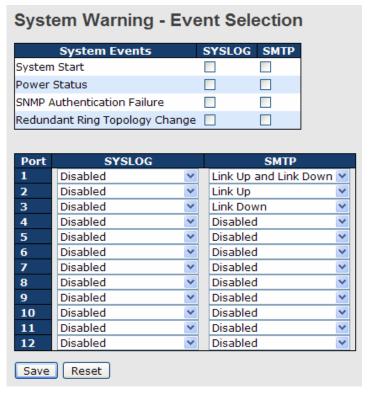

The following table describes the labels in this screen.

Label	Description
E-mail Alarm	Enable/Disable transmission system warning events by e-mail.
Sender E-mail	The SMTP server IP address
Address	
Mail Subject	The Subject of the mail
Authentication	■ Username: the authentication username.
	■ Password: the authentication password.
	■ Confirm Password: re-enter password.
Recipient E-mail	The recipient's E-mail address. It supports 6 recipients for a
Address	mail.
Apply	Click "Apply" to activate the configurations.
Help	Show help file.

5.1.11.2.3 Event Selection

SYSLOG and SMTP are the two warning methods that supported by the system. Check the corresponding box to enable system event warning method you wish to choose. Please note that the checkbox cannot be checked when SYSLOG or SMTP is disabled.

System Warning – Event Selection interface

The following table describes the labels in this screen.

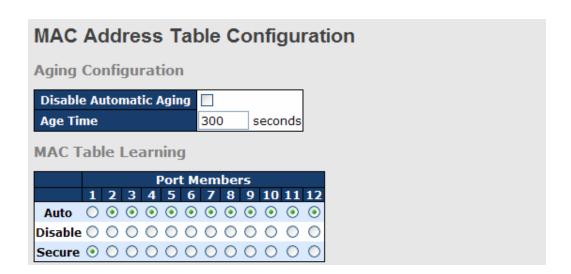

Label	Description	
System Event		
System Cold Start	Alert when system restart	
Power Status	Alert when a power up or down	
SNMP Authentication	Alert when SNMP authentication failure.	
Failure		
O-Ring Topology	Alert when O-Ring topology changes.	
Change		
Port Event	■ Disable	
SYSLOG / SMTP	■ Link Up	
event	■ Link Down	
	■ Link Up & Link Down	
Apply	Click "Apply" to activate the configurations.	
Help	Show help file.	

5.1.12 Monitor and Diag

5.1.12.1 MAC Table

5.1.12.1.1 Configuration

The MAC Address Table is configured on this page. Set timeouts for entries in the dynamic MAC Table and configure the static MAC table here.

	Port Members
Delete VLAN ID MAC Address 1	2 3 4 5 6 7 8 9 10 11 12
1 00-1E-94-98-89-89 ✓ [

Aging Configuration

By default, dynamic entries are removed from the MAC after 300 seconds. This removal is also called aging.

Configure aging time by entering a value here in seconds; for example, Age

time seconds.

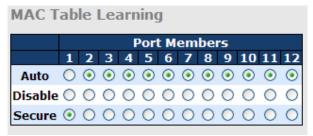

The allowed range is 10 to 1000000 seconds.

Disable the automatic aging of dynamic entries by checking \Box Disable automatic aging.

MAC Table Learning

If the learning mode for a given port is grayed out, another module is in control of the mode, so that it cannot be changed by the user. An example of such a module is the MAC-Based Authentication under 802.1X.

Each port can do learning based upon the following settings:

Label	Description
Auto	Learning is done automatically as soon as a frame with unknown
Auto	SMAC is received.
Disable	No learning is done.
	Only static MAC entries are learned, all other frames are dropped.
Secure	Note: Make sure that the link used for managing the switch is
	added to the Static Mac Table before changing to secure learning

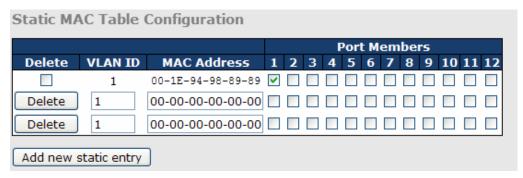

mode, otherwise the management link is lost and can only be
restored by using another non-secure port or by connecting to the
switch via the serial interface.

Static MAC Table Configuration

The static entries in the MAC table are shown in this table. The static MAC table can contain 64 entries.

The maximum of 64 entries is for the whole stack, and not per switch.

The MAC table is sorted first by VLAN ID and then by MAC address.

Label	Description
Delete	Check to delete the entry. It will be deleted during the next save.
VLAN ID	The VLAN ID for the entry.
MAC Address	The MAC address for the entry.
Port Members	Checkmarks indicate which ports are members of the entry. Check or uncheck as needed to modify the entry.
Adding a New Static Entry	Click Add new static entry to add a new entry to the static MAC table. Specify the VLAN ID, MAC address, and port members for the new entry. Click "Save".

5.1.12.1.2 MAC Table

Each page shows up to 999 entries from the MAC table, default being 20, selected through the "entries per page" input field. When first visited, the web page will show the first 20 entries from the beginning of the MAC Table. The first displayed will be the one with the lowest VLAN ID and the lowest MAC address found in the MAC Table.

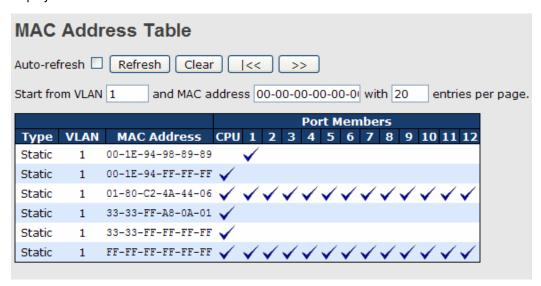

The "Start from MAC address" and "VLAN" input fields allow the user to select the starting

point in the MAC Table. Clicking the Refresh button will update the displayed table starting from that or the closest next MAC Table match. In addition, the two input fields will -

upon a Refresh button click - assume the value of the first displayed entry, allowing for continuous refresh with the same start address.

The will use the last entry of the currently displayed VLAN/MAC address pairs as a basis for the next lookup. When the end is reached the text "no more entries" is shown in the displayed table. Use the

Label	Description
Туре	Indicates whether the entry is a static or dynamic entry.
MAC address	The MAC address of the entry.
VLAN	The VLAN ID of the entry.
Port Members	The ports that are members of the entry.

5.1.12.2 Port Statistic

5.1.12.2.1 Traffic Overview

This page provides an overview of general traffic statistics for all switch ports.

	Port Statistics Overview Auto-refresh Refresh Clear								
Port	Pacl	kets	Ву	tes	Err	rors	Dre	ops	Filtered

Label	Description
Port	The logical port for the settings contained in the same row.
Packets	The number of received and transmitted packets per port.
Bytes	The number of received and transmitted bytes per port.
Errors	The number of frames received in error and the number of
Ellois	incomplete transmissions per port.
Drops	The number of frames discarded due to ingress or egress
Біорэ	congestion.
Filtered	The number of received frames filtered by the forwarding process.
Auto-refresh	Check this box to enable an automatic refresh of the page at regular
Auto-refresh 🗀	intervals.
Refresh	Updates the counters entries, starting from the current entry ID.
Clear	Flushes all counters entries.

5.1.12.2.2 Detailed Statistics

This page provides detailed traffic statistics for a specific switch port. Use the port select box to select which switch port details to display.

The displayed counters are the totals for receive and transmit, the size counters for receive and transmit, and the error counters for receive and transmit.

Detailed Statistics-Receive & Transmit Total

Detailed Port Statistics Port 1				
Port 1 V Auto-refresh Refresh	Clear			
Receive Total		Transmit Total		
Rx Packets	118043		86946171	
Rx Octets	9134074		6259924740	
Rx Unicast	117745	Tx Unicast	7348	
Rx Multicast	225	Tx Multicast	26712756	
Rx Broadcast	70	Tx Broadcast	60226067	
Rx Pause	0	Tx Pause	0	
Receive Size Counters		Transmit Size Counters		
Rx 64 Bytes	113373	Tx 64 Bytes	60226305	
Rx 65-127 Bytes	1315	Tx 65-127 Bytes	26716197	
Rx 128-255 Bytes	243	Tx 128-255 Bytes	3419	
Rx 256-511 Bytes	4	Tx 256-511 Bytes	57	
Rx 512-1023 Bytes	3107		18	
Rx 1024-1526 Bytes		Tx 1024-1526 Bytes	175	
Rx 1527- Bytes	0	Tx 1527- Bytes	0	
Receive Queue Counters		Transmit Queue Counters		
Rx Low	117815	Tx Low	86938819	
Rx Normal	0	Tx Normal	0	
Rx Medium	0	Tx Medium	0	
Rx High	225	Tx High	7352	
Receive Error Counters		Transmit Error Counters		
Rx Drops		Tx Drops	0	
Rx CRC/Alignment	2	Tx Late/Exc. Coll.	0	
Rx Undersize	0			
Rx Oversize	0			
Rx Fragments	1			
Rx Jabber	0			
Rx Filtered	0			

Label	Description
Rx and Tx Packets	The number of received and transmitted (good and bad) packets.
Rx and Tx Octets	The number of received and transmitted (good and bad) bytes.
nx and 1x octets	Includes FCS, but excludes framing bits.
Rx and Tx Unicast	The number of received and transmitted (good and bad) unicast
Tix and Tx Officast	packets.
Rx and Tx	The number of received and transmitted (good and bad) multicast
Multicast	packets.
Rx and Tx	The number of received and transmitted (good and bad) broadcast
Broadcast	packets.
Rx and Tx Pause	A count of the MAC Control frames received or transmitted on this
nx aliu ix Pause	port that have an opcode indicating a PAUSE operation.
Rx Drops	The number of frames dropped due to lack of receive buffers or
нх вторя	egress congestion.
Rx	The number of frames received with CRC or alignment errors.
CRC/Alignment	
Rx Undersize	The number of short 1 frames received with valid CRC.
Rx Oversize	The number of long 2 frames received with valid CRC.
Rx Fragments	The number of short 1 frames received with invalid CRC.
Rx Jabber	The number of long 2 frames received with invalid CRC.

Rx Filtered	The number of received frames filtered by the forwarding process.
Tx Drops	The number of frames dropped due to output buffer congestion.
Tx Late / Exc.Coll.	The number of frames dropped due to excessive or late collisions.

Short frames are frames that are smaller than 64 bytes.

Long frames are frames that are longer than the configured maximum frame length for this port.

5.1.12.3 Port Mirroring

Configure port Mirroring on this page.

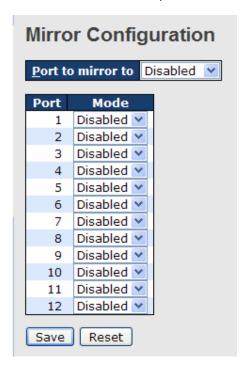

To debug network problems, selected traffic can be copied, or mirrored, to a mirror port where a frame analyzer can be attached to analyze the frame flow.

The traffic to be copied to the mirror port is selected as follows:

All frames received on a given port (also known as ingress or source mirroring).

All frames transmitted on a given port (also known as egress or destination mirroring).

Port to mirror also knwon as the mirror port. Frames from ports that have either source (rx) or destination (tx) mirroring enabled are mirrored to this port. Disabled disables mirroring.

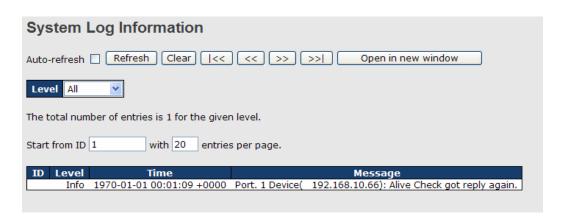

Label	Description		
Port	The logical port for the settings contained in the same row.		
	Select mirror mode.		
	Rx only: Frames received at this port are mirrored to the mirror port.		
	Frames transmitted are not mirrored.		
	Tx only :Frames transmitted from this port are mirrored to the mirror		
	port. Frames received are not mirrored.		
	Disabled: Neither frames transmitted nor frames received are		
Mode	mirrored.		
Mode	Enabled : Frames received and frames transmitted are mirrored to		
	the mirror port.		
	Note: For a given port, a frame is only transmitted once. It is		
	therefore not possible to mirror Tx frames for the mirror port.		
	Because of this, mode for the selected mirror port is limited to		
	Disabled or Rx only.		

5.1.12.4 System Log Information

The switch system log information is provided here.

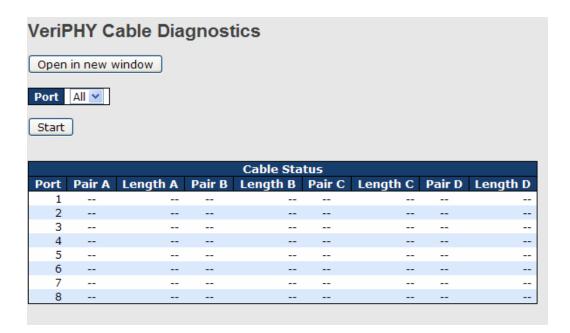

Label	Description		
ID	The ID (>= 1) of the system log entry.		
	The level of the system log entry. The following level types are		
Level	supported:		
Levei	Info: Information level of the system log.		
	Warning: Warning level of the system log.		

	Error: Error level of the system log.
	All: All levels.
Time	The time of the system log entry.
Message	The MAC Address of this switch.
Auto-refresh	Check this box to enable an automatic refresh of the page at regular
Auto-reliesh 🗀	intervals.
Refresh	Updates the system log entries, starting from the current entry ID.
Clear	Flushes all system log entries.
lee.	Updates the system log entries, starting from the first available entry
	ID.
<<	Updates the system log entries, ending at the last entry currently
	displayed.
	Updates the system log entries, starting from the last entry currently
	displayed.
>>	Updates the system log entries, ending at the last available entry ID.

5.1.12.5 Cable Diagnostics

This page is used for running the VeriPHY Cable Diagnostics.

Press Start to run the diagnostics. This will take approximately 5 seconds. If all

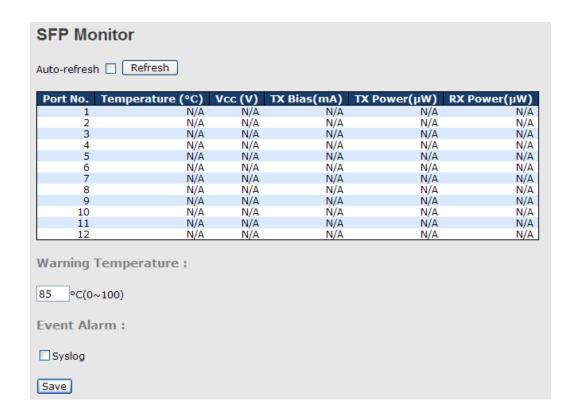

ports are selected, this can take approximately 15 seconds. When completed, the page refreshes automatically, and you can view the cable diagnostics results in the cable status table. Note that VeriPHY is only accurate for cables of length 7 - 140 meters. 10 and 100 Mbps ports will be linked down while running VeriPHY. Therefore, running VeriPHY on a 10 or 100 Mbps management port will cause the switch to stop responding until VeriPHY is complete.

Label	Description	
Port	The port where you are requesting VeriPHY Cable Diagnostics.	
Cable Status	Port: Port number.	
Pair: The status of the cable pair.		
	Length: The length (in meters) of the cable pair.	

5.1.12.6 SFP Monitor

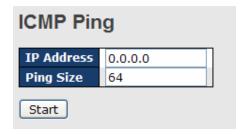

DDM function, can pass SFP module which supports DDM function, measure the temperature of the apparatus .And manage and set up event alarm module through DDM WEB

5.1.12.7 Ping

This page allows you to issue ICMP PING packets to troubleshoot IP connectivity issues.

After you press Start, 5 ICMP packets are transmitted, and the sequence number and roundtrip time are displayed upon reception of a reply. The page refreshes automatically until responses to all packets are received, or until a timeout occurs.

PING6 server :: 10.10.132.20

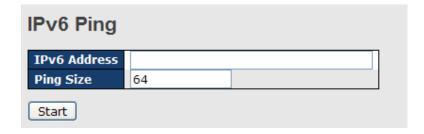

64 bytes from ::10.10.132.20: icmp_seq=0, time=0ms 64 bytes from ::10.10.132.20: icmp_seq=1, time=0ms 64 bytes from ::10.10.132.20: icmp_seq=2, time=0ms 64 bytes from ::10.10.132.20: icmp_seq=3, time=0ms 64 bytes from ::10.10.132.20: icmp_seq=4, time=0ms

Sent 5 packets, received 5 OK, 0 bad

You can configure the following properties of the issued ICMP packets:

Label	Description	
IP Address	The destination IP Address.	
Ping Size The payload size of the ICMP packet. Values range from		
	to 1400 bytes.	

5.1.12.8 IPv6 Ping

PING6 server ::192.168.10.1

sendto

sendto

sendto

sendto

sendto

Sent 5 packets, received 0 OK, 0 bad

5.1.13 Factory Defaults

You can reset the configuration of the stack switch on this page. Only the IP configuration is retained.

Factory Defaults

Are you sure you want to reset the configuration to Factory Defaults?

Label	Description
Yes	Click to reset the configuration to Factory Defaults.
No	Click to return to the Port State page without resetting the configuration

5.1.14 System Reboot

You can reset the stack switch on this page. After reset, the system will boot normally as if you had powered-on the devices

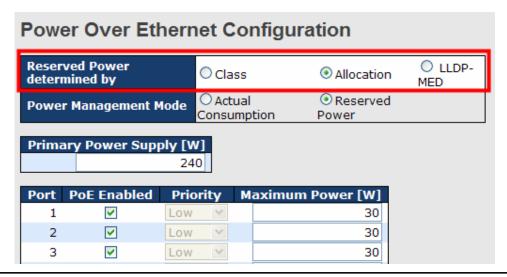

Label	Description
Yes	Click to reboot device.
No	Click to return to the Port State page without rebooting.

5.1.15 Power Over Ethernet

5.1.15.1 PoE Configuration - Reserved Power determined

There are three modes for configuring how the ports/PDs may reserve power.

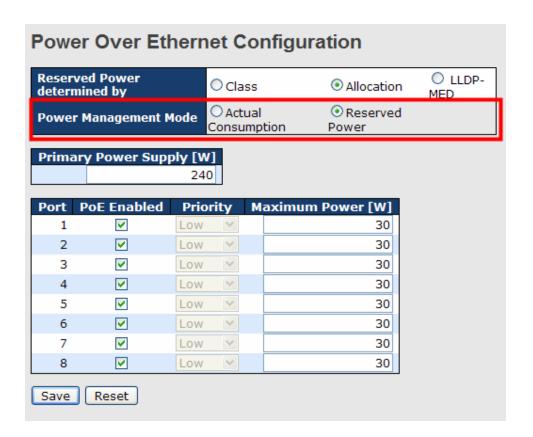

Label	Description
Allocated mode	In this mode the user allocates the amount of power that each
	port may reserve. The allocated/reserved power for each port/PD
	is specified in the Maximum Power fields.
Class mode	In this mode each port automatic determines how much power to
	reserve according to the class the connected PD belongs to, and
	reserves the power accordingly. Three different port classes exist
	and one for 4, 7 and 15.4 Watts. (In this mode the Maximum
	Power fields have no effect.)
LLDP-MED mode	This mode is similar to the Class mode expect that each port
	determine the amount power it reserves by exchanging PoE
	information using the LLDP protocol and reserves power
	accordingly. If no LLDP information is available for a port, the port
	will reserve power using the class mode.(In this mode the
	Maximum Power fields have no effect)

(For all mode: If a port uses more power than the reserved power for the port, the port is shut down.)

5.1.15.2 PoE Configuration - Power management Mode

There are 2 modes for configuring when to the ports are shut down.

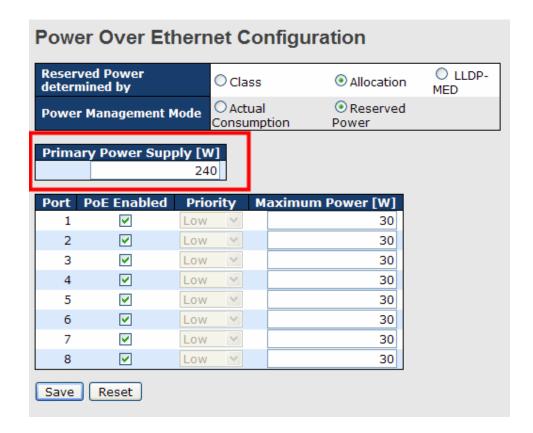

Label	Description
Actual Consumption	In this mode the ports are shut down when the actual power
	consumption for all ports exceeds the amount of power that the
	power supply can deliver or if the actual power consumption for a
	given port exceeds the reserved power for that port. The ports are
	shut down according to the ports priority. If two ports have the
	same priority the port with the highest port number is shut down.
Reserved Power	In this mode the ports are shut down when total reserved powered
	exceeds the amount of power that the power supply can deliver.
	In this mode the port power is not turned on if the PD requests
	more power the available.

5.1.15.3 PoE Configuration - Primary Power Supply

primary power source, user can setting maximum input power range.

5.1.15.4 PoE Configuration - Port Configuration

User can configuration every port PoE Setting

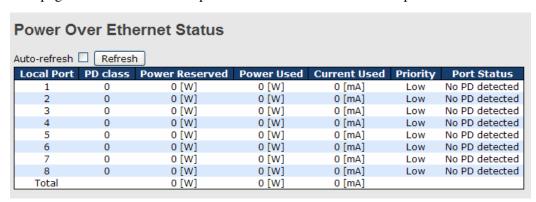

Label	Description
PoE Enable	The PoE Enabled represents whether the PoE is enable for the
	port.
Priority	The Priority represents the ports priority. There are three levels of
	power priority named Low, High and Critical.
	The priority is used in the case where the remote devices requires
	uses more power than power supply can deliver. In this case the
	port with the lowest priority will be turn off starting from the port
	with the lowest port number.
Maximum Power	The Maximum Power value contains a numerical value that
	indicates the maximum power in watts that can be delived to a
	remote device.(The maximum allowed value is 102.3 W.)
Save	Click to save changes.
Reset	Click to undo any changes made locally and revert to previously
Reset	saved values.

5.1.15.5 Power over Ethernet Status

This page allows the user to inspect the current status for all PoE ports.

Label	Description
Local Port	This is the logical port number for this row.
Power Reserved	The Power Reserved shows how much the power the PD has
	reserved.
Power Used	The Power Used shows how much power the PD currently is
	using.
Current Used	The Power Used shows how much current the PD currently is

	using. P.O.E. ports
Priority	The Priority shows the port's priority configured by the user.
Port Status	The Port Status shows the port's status.

5.1.15.6 LLDP Power Over Ethernet Neighbor

This page provides a status overview for all LLDP PoE neighbors. The displayed table contains a row for each port on which an LLDP PoE neighbor is detected. The columns hold the following information:

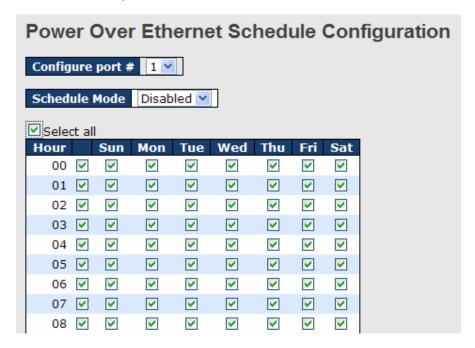

Label	Description
Local Port	The port for this switch on which the LLDP frame was received.
Power Type	The Type represents whether the device is a Power Sourcing
	Entity (PSE) or Power Device (PD).
	If the Type is unknown it is represented as "Resevered".
Power Source	The Source represents the power source being utilized by a PSE
	or PD device.
	If the device is a PSE device it can either run on its Primary Power
	Source or its Backup Power Source. If it is unknown whether the
	PSE device is using its Primary Power Source or its Backup
	Power Source it is indicated as "Unknown"
	If the device is a PD device it can either run on its local power
	supply or it can use the PSE as power source. It can also use
	both its local power supply and the PSE.
	If it is unknown what power supply the PD device is using it is
	indicated as "Unknown"
Power Priority	The Power Used shows how much current the PD currently is
	using. P.O.E. ports
Power Priority	Power Priority represents the priority of the PD device, or the
	power priority associated with the PSE type device's port that is
	sourcing the power. There are three levels of power priority. The

	three levels are: Critical, High and Low.
	If the power priority is unknown it is indicated as "Unknown"
Maximum Power	The Power Value contains a numerical value that indicates the
	maximum power in watts required by a PD device from a PSE
	device, or the minimum power a PSE device is capable of
	sourcing over a maximum length cable based on its current
	configuration.
	The maximum allowed value is 102.3 W. If the device indicates
	value higher than 102.3 W, it is represented as "reserved"
Refresh	Click to refresh the page immediately.
Auto-refresh	Check this box to enable an automatic refresh of the page at
	regular intervals.

5.1.15.7 PoE Schedule

User can appointed date and time, Enable or Close Power Over Ethernet Function, switch can with according to the time when is set up, carry on the designated movements (SNTP Function must Enable)

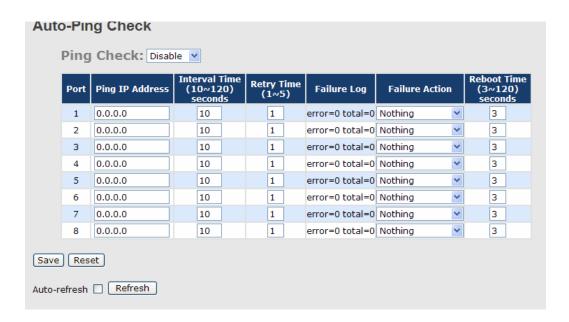

The following table describes the labels in this screen.

Label	Description
Configure port	Setting action port
Schedule mode	Schedule mode enable or disable
Select all	Select all Data & Time
Hour	Set up enable Time
Sunday~Saturday	Set up enable Data

5.1.15.8 Auto-Ping Check

You can control the POE function by using the ping command, in order to turn on or off other POE device which connect with port assign.

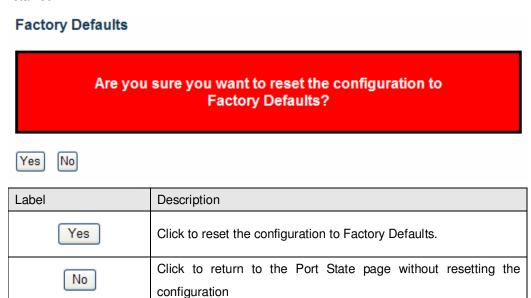

The following table describes the labels in this screen.

Label	Description
Ping Check	Enable or disable Ping Check function
Port	You can appoint to want to control P.O.E port number
Ping IP Address	Set up ip Address
Interval Time	Spacing interval to set up Ping(10 Sec~120 Sec)
Retry Time	Set up the number of times of ping
Failure Log	Note down " Ping Check " a result of movement after starting.
Failure Action	Set up movements wanted to carry out
Reboot Time	Switch ping check failure " P.O.E " restarts the buffer time of
	switch.

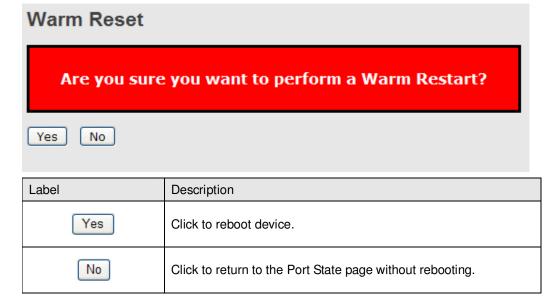

5.1.16 Factory Defaults

You can reset the configuration of the stack switch on this page. Only the IP configuration is retained.

5.1.17 System Reboot

You can reset the stack switch on this page. After reset, the system will boot normally as if you had powered-on the devices

Command Line Interface Management

6.1 About CLI Management

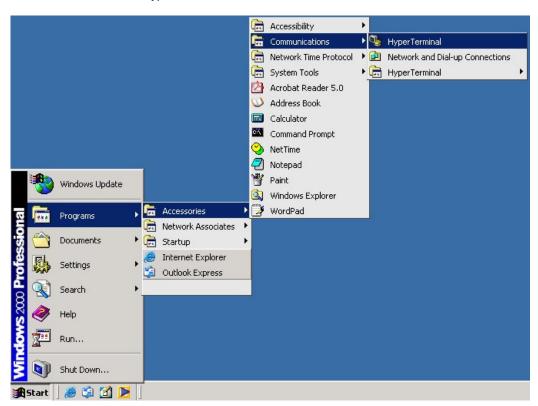

Besides WEB-base management, IES-3073GC also support CLI management. You can use console or telnet to management switch by CLI.

CLI Management by RS-232 Serial Console (115200, 8, none, 1, none)

Before Configuring by RS-232 serial console, use an RJ45 to DB9-F cable to connect the Switches' RS-232 Console port to your PC's COM port.

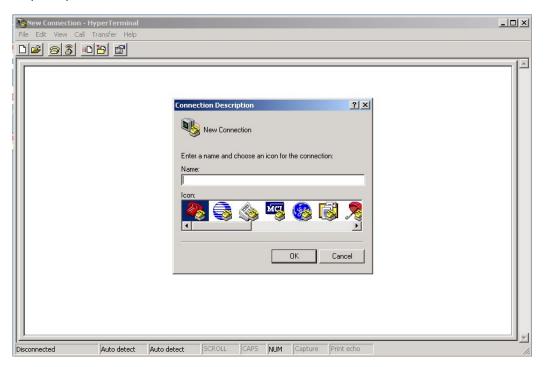

Follow the steps below to access the console via RS-232 serial cable.

Step 1. From the Windows desktop, click on Start -> Programs -> Accessories -> Communications -> Hyper Terminal

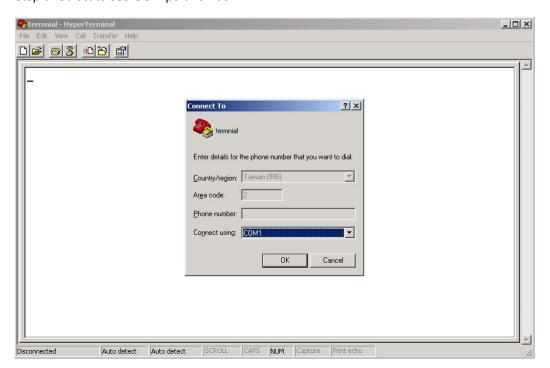

Step 2. Input a name for new connection

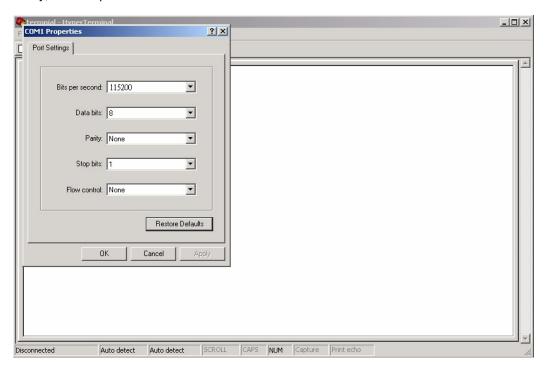

Step 3. Select to use COM port number

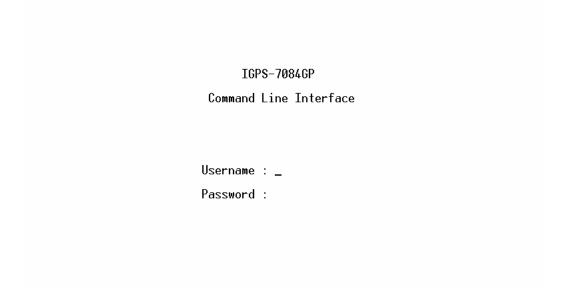

Step 4. The COM port properties setting, 115200 for Bits per second, 8 for Data bits, None for Parity, 1 for Stop bits and none for Flow control.

Step 5. The Console login screen will appear. Use the keyboard to enter the Username and Password (The same with the password for Web Browser), then press "**Enter**".

CLI Management by Telnet

Users can use "TELNET" to configure the switches.

The default value is as below:

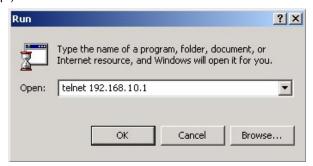

IP Address: **192.168.10.1** Subnet Mask: **255.255.255.0**

Default Gateway: 192.168.10.254

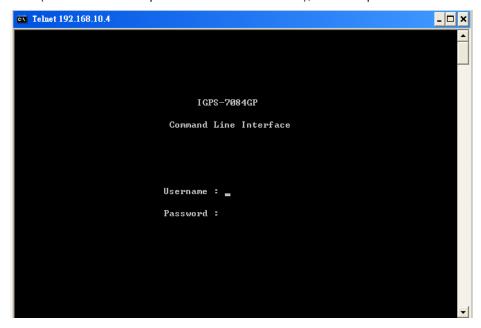

User Name: admin
Password: admin

Follow the steps below to access the console via Telnet.

Step 1. Telnet to the IP address of the switch from the Windows "Run" command (or from the MS-DOS prompt) as below.

Step 2. The Login screen will appear. Use the keyboard to enter the Username and Password (The same with the password for Web Browser), and then press "Enter"

Technical Specifications

ORing Switch Model	IGPS-7084GP
Physical Ports	
10/100/1000Base-T(X) with P.S.E.	
ports in RJ45 Auto MDI/MDIX	8
1000Base-X SFP Port	4
Technology	
Ethernet Standards	IEEE 802.3 for 10Base-T, IEEE 802.3u for 100Base-TX IEEE 802.3z for 1000Base-X IEEE 802.3ab for 1000Base-T, IEEE 802.3ab for 1000Base-T, IEEE 802.3x for Flow control IEEE 802.3d for LACP (Link Aggregation Control Protocol) IEEE 802.1D for STP (Spanning Tree Protocol) IEEE 802.1p for COS (Class of Service) IEEE 802.1v for VLAN Tagging IEEE 802.1w for RSTP (Rapid Spanning Tree Protocol)
	IEEE 802.1s for MSTP (Multiple Spanning Tree Protocol) IEEE 802.1x for Authentication IEEE 802.1AB for LLDP (Link Layer Discovery Protocol) IEEE 802.3at PoE specification (up to 30 Watts per port for P.S.E.)
MAC Table	8192 MAC addresses
Priority Queues Processing	4 Store-and-Forward
Switch Properties	Switching latency: 7 us Switching bandwidth: 24Gbps Max. Number of Available VLANs: 256 IGMP multicast groups: 128 for each VLAN Port rate limiting: User Define
Security Features	Device Binding security feature Enable/disable ports, MAC based port security Port based network access control (802.1x) VLAN (802.1Q) to segregate and secure network traffic Radius centralized password management SNMPv3 encrypted authentication and access security Https / SSH enhance network security
Jumbo Frame	Up to 9K Bytes
Software Features	STP/RSTP/MSTP (IEEE 802.1D/w/s) Redundant Ring (O-Ring) with recovery time less than 30ms over 250 units TOS/Diffserv supported Quality of Service (802.1p) for real-time traffic VLAN (802.1Q) with VLAN tagging and GVRP supported IGMP Snooping IP-based bandwidth management Application-based QoS management DOS/DDOS auto prevention Port configuration, status, statistics, monitoring, security DHCP Client/Server SMTP Client
Network Redundancy	O-Ring Fast Recovery Mode STP / RSTP MSTP
RS-232 Serial Console Port	RS-232 in RJ45 connector with console cable. 115200bps, 8, N, 1
LED Indicators	
Power indicator	Green: Power LED x 3
R.M. indicator	Green : indicate system operated in O-Ring Master mode

Ring indicator	Green: indicate system operated in O-Ring mode
Fault indicator	Amber : Indicate excepted event occurred
10/100/1000Base-T(X) RJ45 port indicator	Green for port Link/Act.
PoE indicator	Green for PoE enable indicator
1000Base-X Fiber port indicator	Green for port Link/Act.
Fault contact	
Relay	Relay output to carry capacity of 1A at 24VDC
Power	
Redundant Input power	Dual DC inputs. 50~57VDC on 6-pin terminal block
Power consumption (Typ.)	20Watts (power device not included)
Overload current protection	Present
Reverse polarity protection	Not Present
Physical Characteristic	
Enclosure	IP-30
Dimension (W x D x H)	96.4 (W) x 108.5 (D) x 154 (H) mm (3.8 x 4.2.7 x 6.06 inch)
Weight (g)	1400g
Environmental	
Storage Temperature	-40 to 85°C (-40 to 185°F)
Operating Temperature	-40 to 70°C (-40 to 158°F)
Operating Humidity	5% to 95% Non-condensing
Regulatory approvals	
EMI	FCC Part 15, CISPR (EN55022) class A
EMS	EN61000-4-2 (ESD), EN61000-4-3 (RS), EN61000-4-4 (EFT), EN61000-4-5 (Surge), EN61000-4-6 (CS), EN61000-4-8, EN61000-4-11
Shock	IEC60068-2-27
Free Fall	IEC60068-2-32
Vibration	IEC60068-2-6
Safety	EN60950-1
Warranty	5 years
