#### REGULATORY COMPLIANCE STATEMENT

Product(s) associated with this publication complies/comply with all applicable regulations. Please refer to the Technical Specifications section for more details.

#### WARRANTY

ORing warrants that all ORing products are free from defects in material and workmanship for a specified warranty period from the invoice date (5 years for most products). ORing will repair or replace products found by ORing to be defective within this warranty period, with shipment expenses apportioned by ORing and the distributor. This warranty does not cover product modifications or repairs done by persons other than ORing-approved personnel, and this warranty does not apply to ORing products that are misused, abused, improperly installed, or damaged by accidents.

Please refer to the Technical Specifications section for the actual warranty period(s) of the product(s) associated with this publication.

#### **DISCLAIMER**

Information in this publication is intended to be accurate. ORing shall not be responsible for its use or infringements on third-parties as a result of its use. There may occasionally be unintentional errors on this publication. ORing reserves the right to revise the contents of this publication without notice.

# **Getting Started**

## 1.1 About the TGS-9200-M12

The TGS-9200-M12 series is a managed Gigabit Ethernet switch with 20x10/100/1000Base-T(X) ports. The series consists of BP2 models (TGS-9200-M12-BP2) and non-BP2 models (TGS-9200-M12). The BP2 models provide bypass functions to ensure constant network connectivity if power outage or node failure occurs. In such situations, the device will bypass the inactive switch and continue to transfer network traffic to the next switch in the relay. The series supports various Ethernet redundancy protocols such as O-Ring (recovery time < 30ms over 250 units of connection), Open-Ring, O-Chain, MRP and MSTP (RSTP/STP compatible) to protect your mission-critical applications from network interruptions or temporary malfunctions. With EN50155 compliance and M12 connectors, the series is a perfect choice for tough industrial environments as the features can ensure tight, robust connections, and guarantee reliable operation against environmental disturbances, such as vibration and shock. Supporting wide operating temperature from -40 to 75 degrees, the device can be managed centrally via Open-Vision, the Web-based interface, Telnet and console (CLI) configuration.

# 1.2 Software Features

- Supports Open-Ring interoperates with other vendors' ring technology in open architecture
- Supports O-Ring (recovery time < 30ms over 250 units of connection) and MSTP(RSTP/STP compatible) for Ethernet Redundancy
- Supports O-Chain that allows the device to operate in multiple redundant ring topologies
- Supports standard IEC 62439-2 MRP (Media Redundancy Protocol)
- Supports IEEE 1588v2 clock synchronization
- Supports IPv6 new Internet protocol version
- Supports Modbus TCP protocol
- HTTPS/SSH protocols for higher network security
- Supports IEEE 802.3az Energy-Efficient Ethernet technology
- Supports SMTP client
- Supports IP-based bandwidth management
- Supports application-based QoS management
- Supports Device Binding security
- Supports DOS/DDOS auto prevention
- IGMP v2/v3 (IGMP snooping support) for filtering multicast traffic

- Supports SNMP v1/v2c/v3 & RMON & 802.1Q VLAN network management
- Supports ACL, TACACS+ and 802.1x user authentication
- Supports 9.6K bytes Jumbo frame
- Multiple notifications during unexpected events
- Configuration via Web-based ,Telnet, Console (CLI), and Windows utility (Open-Vision)
- Supports LLDP Protocol

# 1.3 Hardware Specifications

- 20x10/100/1000Base-T(X) ports
- 1 x console port
- 2 sets of bypass ports (TGS-9200-M12-BP2)
- EN50155-compliance
- Redundant DC power inputs
- Operating temperature: -40 to 75°C
- Storage temperature: -40 to 85°C
- Operating humidity: 5% to 95%, non-condensing
- Casing: IP-30
- Dimensions: 260 (W) x 91.6 (D) x228 (H) mm

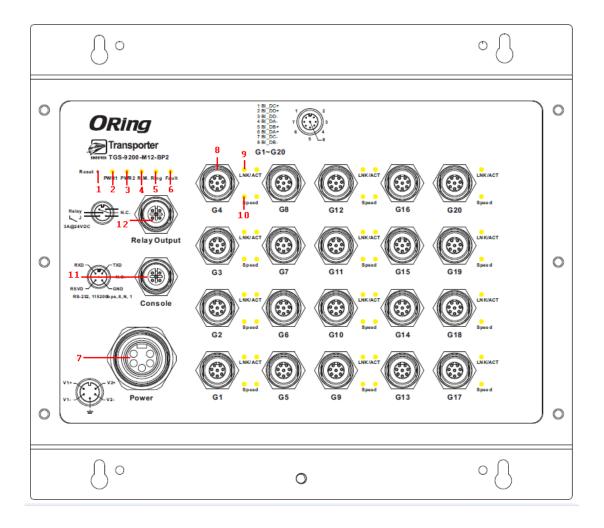

# **Hardware Overview**

# 2.1 Front Panel

The device provides the following ports on the front panel. All connectors are in M12 type to ensure tight, robust connections, as well as reliable operation against environmental disturbances, such as vibration and shock.

Port	Description	
Power	1 x power connector	
connector		
Ethernet ports	20 x 10/100/1000Base-T(X) M12 ports	
Console	1 x console port	
Relay output	1 x relay output	
Reset button	1 x reset button	

Reset button
 Power connector

2. Power 1 LED 8. Gigabit Ethernet ports (G1 – G4 of BP2 model

3. Power 2 LED are bypass ports)

4. R.M status LED 9. Link/ACT LED for Gigabit ports

5. Ring status LED 10. Speed LED for Gigabit ports

6. Fault LED 11. Console port

12. Relay output

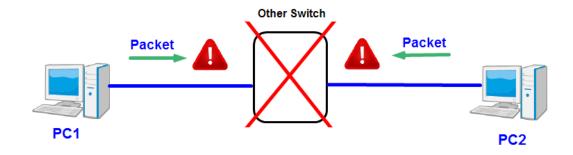

## 2.2 Front Panel LED

LED	Color	Status	Description
PW1	Green	On	DC power module 1 activated
PW2	Green	On	DC power module 2 activated
R.M	Green	On	Device operating in Ring Master mode
	_	On	Ring enabled
Ring	Green		Ring structure is broken
Fault	Amber	On	Errors occur (i.e. power failure or port
rauit			malfunctioning)
10/100/1000Base-T(X) Ethernet ports			
LNK/ACT	Green	On	Port is linked
LINN/ACT	Gleen	Blinking	Transmitting data
	Green	On	Port is running at 1000Mbps
Speed	Amber	On	Port is running at 100Mbps
	Green/Amber		Port is running at 10Mbps

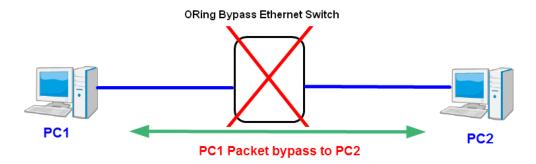

# 2.3 Bypass Technology (TGS-9200-M12-BP2 Only)

When a device connected to other devices through a switch without bypass function, the device will lose connection if he switch loses power as traffic will not be able to flow through the link (as shown in the figure below).

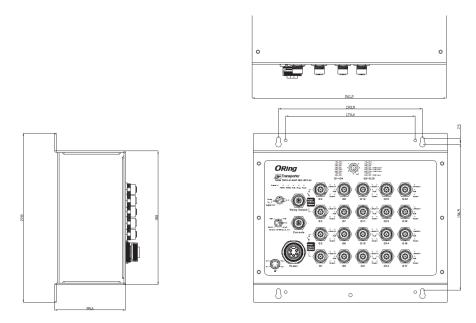

Switches with bypass functions such as the TGS-9200-M12-BP2 provide one or more sets of bypass ports that ensure constant network connectivity during power failure.

# **Hardware Installation**

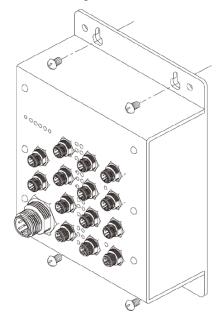

# 3.1 Wall-mount Installation

Wall-mount Measurement (Unit = mm)

Follow the steps below to mount the switch to the wall.

- Step 1: Hold the switch upright against the wall
- Step 2: Insert two screws through the screw holes located at the top and bottom of the unit and fasten the screw to the wall with a screwdriver.
- Step 3: Slide the switch downwards and tighten the screws for added stability.

Instead of screwing the screws in all the way, it is advised to leave a space of about 2mm to allow room for sliding the switch between the wall and the screws.

# 3.2 Wiring

#### WARNING

Do not disconnect modules or wires unless power has been switched off or the area is known to be non-hazardous. The devices may only be connected to the supply voltage shown on the type plate.

#### **ATTENTION**

- 1. Be sure to disconnect the power cord before installing and/or wiring your
  - switches
- Calculate the maximum possible current in each power wire and common wire. Observe all electrical codes dictating the maximum current allowable for each wire size.
- 3. If the current goes above the maximum ratings, the wiring could overheat, causing serious damage to your equipment.
- 4. Use separate paths to route wiring for power and devices. If power wiring and device wiring paths must cross, make sure the wires are perpendicular at the intersection point.
- 5. Do not run signal or communications wiring and power wiring through the same wire conduit. To avoid interference, wires with different signal characteristics should be routed separately.
- 6. You can use the type of signal transmitted through a wire to determine which wires should be kept separate. The rule of thumb is that wiring sharing similar electrical characteristics can be bundled together
- 7. You should separate input wiring from output wiring
- 8. It is advised to label the wiring to all devices in the system

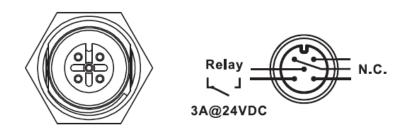

# 3.2.1 Grounding

Grounding and wire routing help limit the effects of noise due to electromagnetic interference (EMI). Run the ground connection on the power connector to the grounding surface prior to connecting devices.

# 3.2.2 Fault Relay

The switch uses the M12 A-coded 5-pin male connector on the front panel for relay output. Use a power cord with an M12 A-coded 5-pin female connector to connect the relay contacts from the switch. The relay contacts will detect user-configured events and form an open circuit when an event is triggered.

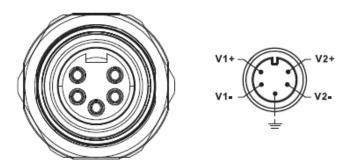

## 3.2.3 Redundant Power Inputs

The switch provides two sets of power supply on a M23 5-pin connector to enable dual power inputs.

Step 1: Insert a power cable to the power connector on the device.

**Step 2**: Rotate the outer ring of the cable connector until a snug fit is achieved. Make sure the connection is tight.

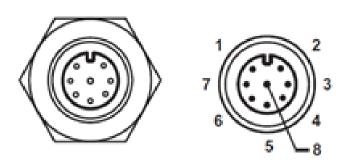

# 3.3 Connection

#### **3.3.1 Cables**

#### 10/100/1000BASE-T(X) Pin Assignments

The device provides Ethernet ports in M12 connector type. According to the link type, the switch uses CAT 3, 4, 5,5e UTP cables to connect to any other network devices (PCs, servers, switches, routers, or hubs). Please refer to the following table for cable specifications.

#### Cable Types and Specifications:

Cable	Туре	Max. Length	Connector	
10BASE-T	Cat. 3, 4, 5 100-ohm	UTP 100 m (328 ft)	M12 A-coding	
TOBAGET	Oat. 3, 4, 5 100 01111	011 100 III (020 II)	connector	
100BASE-TX	Cat. 5 100-ohm UTP	UTP 100 m (328 ft)	M12 A-coding	
100BASE-1X	Cat. 5 100-01111 01F	017 100111 (32811)	connector	
1000BASE-T	Cat. 5/Cat. 5e 100-ohm UTP	UTP 100 m (328ft)	M12 A-coding	
TOUGHSE-T	Cat. 5/Cat. 5e 100-0fill 01P	017 100 111 (32611)	connector	

Below is the pin assignment for the Ethernet ports.

10/100/1000Base-T(X) M12 port

Pin Number	Assignment
#1	BI_DC+
#2	BI_DD+
#3	BI_DD-
#4	BI_DA-
#5	BI_DB+
#6	BI_DA+
#7	BI_DC-
#8	BI_DB-

The device supports auto MDI/MDI-X operation. You can use a cable to connect the switch to a PC. The table below shows the 10/100Base-T(X) MDI and MDI-X port pin outs.

10/100 Base-T(X) MDI/MDI-X Pin Assignments:

Pin Number	MDI port	MDI-X port
1	TD+(transmit)	RD+(receive)
2	TD-(transmit)	RD-(receive)
3	RD+(receive)	TD+(transmit)
4	Not used	Not used
5	Not used	Not used
6	RD-(receive)	TD-(transmit)
7	Not used	Not used
8	Not used	Not used

1000Base-T MDI/MDI-X Pin Assignments:

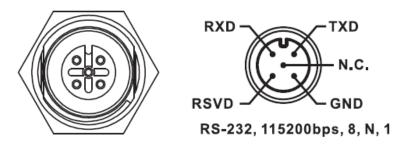

Pin Number	MDI port	MDI-X port
1	BI_DA+	BI_DB+
2	BI_DA-	BI_DB-
3	BI_DB+	BI_DA+
4	BI_DC+	BI_DD+
5	BI_DC-	BI_DD-
6	BI_DB-	BI_DA-
7	BI_DD+	BI_DC+
8	BI_DD-	BI_DC-

Note: "+" and "-" signs represent the polarity of the wires that make up each wire pair.

#### Console port wiring

The switch has one RS-232 (M12 5-pin) console port, located on the front panel. Use a M12-to-DB9 console cable to connect the console port to your PC's COM port.

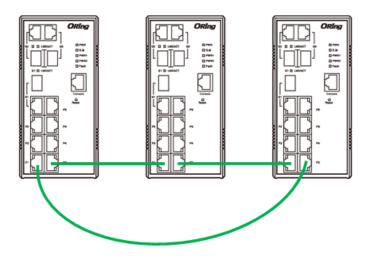

# 3.3.2 O-Ring/O-Chain

#### **O-Ring**

You can connect three or more switches to form a ring topology to gain network redundancy capabilities through the following steps.

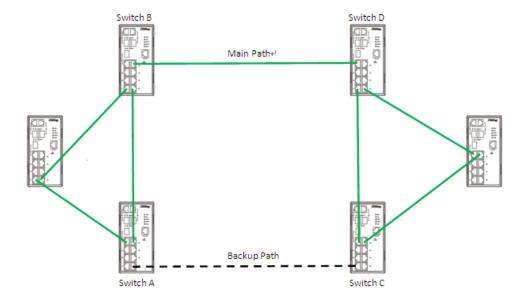

- 1. Connect each switch to form a daisy chain using an Ethernet cable.
- 2. Set one of the connected switches to be the master and make sure the port setting of each connected switch on the management page corresponds to the physical ports connected. For information about the port setting, please refer to <u>4.1.2 Configurations</u>.
- 3. Connect the last switch to the first switch to form a ring topology.

#### **Coupling Ring**

If you already have two O-Ring topologies and would like to connect the rings, you can form them into a coupling ring. All you need to do is select two switches from each ring to be connected, for example, switch A and B from Ring 1 and switch C and D from ring 2. Decide which port on each switch to be used as the coupling port and then link them together, for example, port 1 of switch A to port 2 of switch C and port 1 of switch B to port 2 of switch D. Then, enable Coupling Ring option by checking the checkbox on the management page and select the coupling ring in correspondence to the connected port. For more information on port setting, please refer to <u>4.1.2 Configurations</u>. Once the setting is completed, one of the connections will act as the main path while the other will act as the backup path.

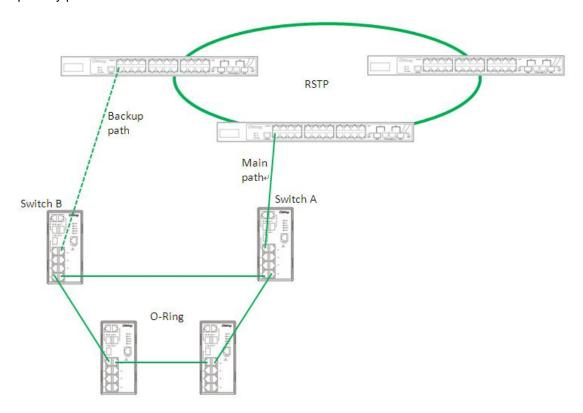

#### **Dual Homing**

If you want to connect your ring topology to a RSTP network environment, you can use dual homing. Choose two switches (Switch A & B) from the ring for connecting to the switches in the

RSTP network (core switches). The connection of one of the switches (Switch A or B) will act as the primary path, while the other will act as the backup path that is activated when the primary path connection fails.

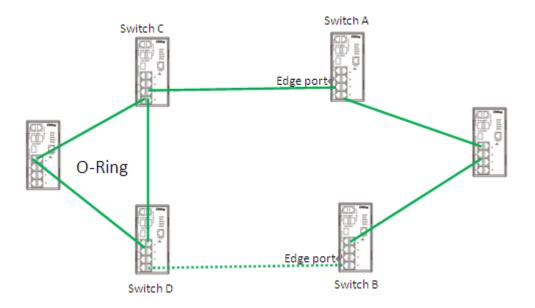

#### **O-Chain**

When connecting multiple O-Rings to meet your expansion demand, you can create an O-Chain topology through the following steps.

- 1. Select two switches from the chain (Switch A & B) that you want to connect to the O-Ring and connect them to the switches in the ring (Switch C & D).
- 2. In correspondence to the port connected to the ring, configure an edge port for both of the connected switches in the chain by checking the box in the management page (see <u>4.1.2</u> <u>Configurations</u>).
- 3. Once the setting is completed, one of the connections will act as the main path, and the other as the backup path.

# Redundancy

Redundancy for minimized system downtime is one of the most important concerns for industrial networking devices. Hence, ORing has developed proprietary redundancy technologies including O-Ring and Open-Ring featuring faster recovery time than existing redundancy technologies widely used in commercial applications, such as STP, RSTP, and MSTP. ORing's proprietary redundancy technologies not only support different networking topologies, but also assure the reliability of the network.

# **4.1 O-Ring**

#### 4.1.1 Introduction

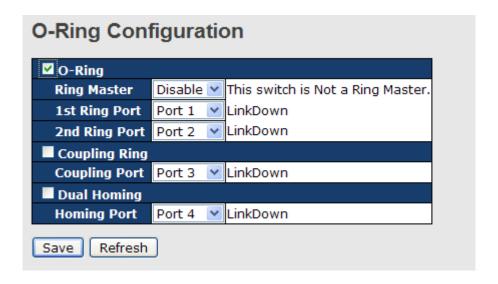

O-Ring is ORing's proprietary redundant ring technology, with recovery time of less than 30 milliseconds (in full-duplex Gigabit operation) or 10 milliseconds (in full-duplex Fast Ethernet operation) and up to 250 nodes. The ring protocols identify one switch as the master of the network, and then automatically block packets from traveling through any of the network's redundant loops. In the event that one branch of the ring gets disconnected from the rest of the network, the protocol automatically readjusts the ring so that the part of the network that was disconnected can reestablish contact with the rest of the network. The O-Ring redundant ring technology can protect mission-critical applications from network interruptions or temporary malfunction with its fast recover technology.

# 4.1.2 Configurations

O-Ring supports three ring topologies: **Ring Master**, **Coupling Ring**, and **Dual Homing**. You can configure the settings in the interface below.

Label	Description
Redundant Ring	Check to enable O-Ring topology.
	Only one ring master is allowed in a ring. However, if more
	than one switches are set to enable Ring Master, the switch
Ring Master	with the lowest MAC address will be the active ring master and
	the others will be backup masters.
1 <sup>st</sup> Ring Port	The primary port when the switch is ring master
2 <sup>nd</sup> Ring Port	The backup port when the switch is ring master
Coupling Ring	Check to enable Coupling Ring. Coupling Ring can divide a
	big ring into two smaller rings to avoid network topology
	changes affecting all switches. It is a good method for
	connecting two rings.
Coupling Port	Ports for connecting multiple rings. A coupling ring needs four
	switches to build an active and a backup link.
	Links formed by the coupling ports will run in active/backup
	mode.
Dual Homing	Check to enable <b>Dual Homing</b> . When <b>Dual Homing</b> is
_	enabled, the ring will be connected to normal switches through
	two RSTP links (ex: backbone Switch). The two links work in
	active/backup mode, and connect each ring to the normal
	switches in RSTP mode.
Apply	Click to apply the configurations.

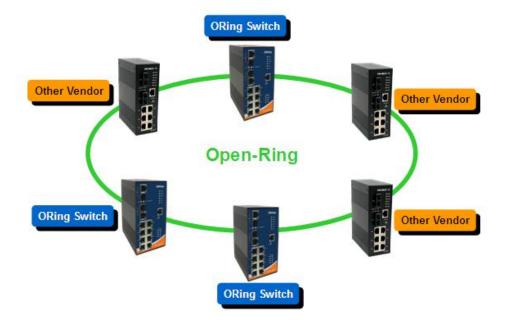

**Note:** due to heavy computing loading, setting one switch as ring master and coupling ring at the same time is not recommended.

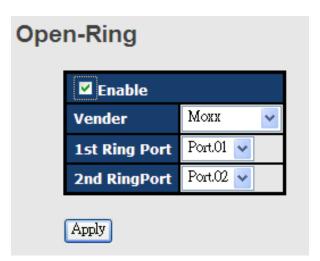

# 4.2 OPEN-Ring

#### 4.2.1 Introduction

Open-Ring is a technology developed by ORing to enhance ORing switches' interoperability with other vendors' products. With this technology, you can add any ORing switches to the network based on other ring technologies.

# 4.2.2 Configurations

Label	Description
Enable	Check to enable Open-Ring topology
Vender	Choose the venders that you want to join in their rings

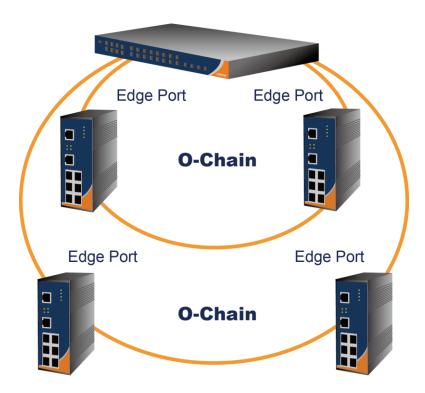

1 <sup>st</sup> Ring Port	The first port to connect to the ring
2 <sup>nd</sup> Ring Port	The second port to connect to the ring

# 4.3 O-Chain

#### 4.3.1 Introduction

O-Chain is ORing's revolutionary network redundancy technology which enhances network redundancy for any backbone networks, providing ease-of-use and maximum fault-recovery swiftness, flexibility, compatibility, and cost-effectiveness in a set of network redundancy topologies. The self-healing Ethernet technology designed for distributed and complex industrial networks enables the network to recover in less than 30 milliseconds (in full-duplex Gigabit operation) or 10 milliseconds (in full-duplex Fast Ethernet operation) for up to 250 switches if at any time a segment of the chain fails.

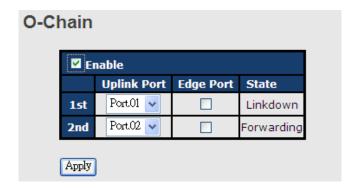

O-Chain allows multiple redundant rings of different redundancy protocols to join and function together as a large and the most robust network topologies. It can create multiple redundant networks beyond the limitations of current redundant ring technologies.

# 4.3.2 Configurations

O-Chain is very easy to configure and manage. Only one edge port of the edge switch needs to be defined. Other switches beside them just need to have O-Chain enabled.

Label	Description
Enable	Check to enable O-Chain function
1 <sup>st</sup> Ring Port	The first port connecting to the ring
2 <sup>nd</sup> Ring Port	The second port connecting to the ring
Edge Port	An O-Chain topology must begin with edge ports. The ports with a
	smaller switch MAC address will serve as the backup link and RM
	LED will light up.

# 4.4 Bypass (TGS-9200-M12-BP2 Only)

#### 4.4.1 Introduction

Bypass provides reliable and uninterrupted connections of inline network devices when any of the devices encounter hardware failure such as power outage. Figure 1 shows the topology consisting of switches without bypass function. When any of the devices breaks down, the network will lose connection.

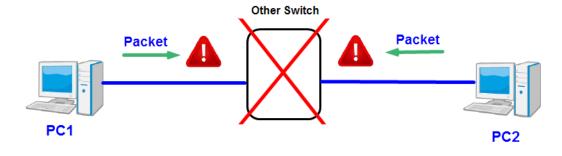

Figure 1

Figure 2 shows the topology consisting of switches with bypass functions. When one of the devices is unavailable, the network traffic will bypass the inactive device and continue to flow to other active devices, ensuring consistent connections.

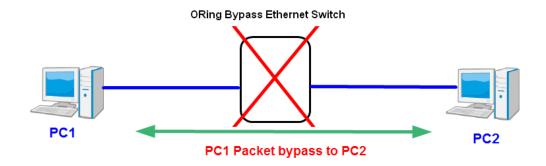

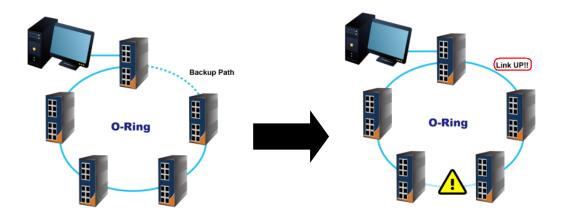

Figure 2

### 4.4.2 Bypass & Ring Topology

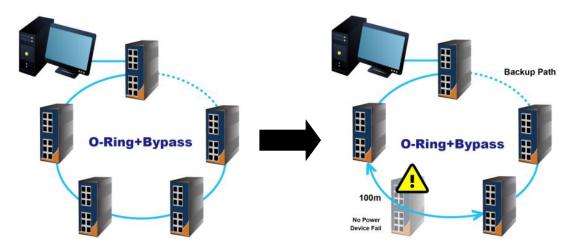

Bypass provides redundancy during device failure and O-Ring provides redundancy when links are broken. Together the two will provide users with dual protection when links and devices are broken.

In a ring topology where switches are not bypass-enabled, the backup link will be activated immediately when one of the links is down, thereby ensuring uninterrupted data transmission. However, if any inline device fails, the network will be disconnected (see below).

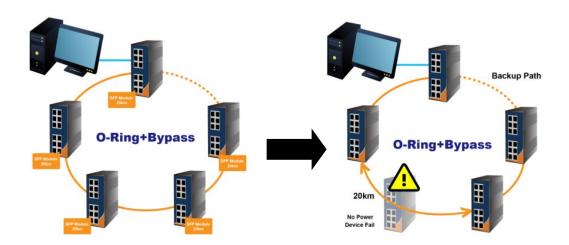

By using bypass-enabled switches in a ring topology, data will continue to flow to the next active switch through the same route when one or more inlay devices fail. Data will bypass the inactive switches during transmission as if they do not exist. In this case, the backup path will remain inactive and the ring topology will remain unchanged (see below).

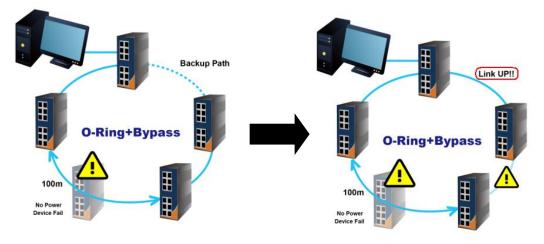

**Fast Ethernet Networks** 

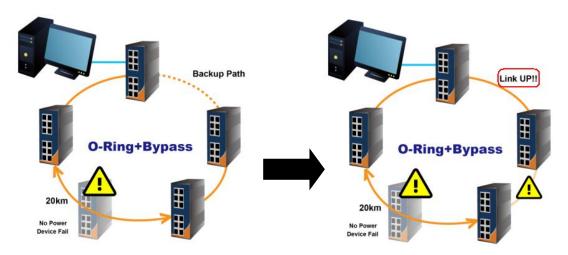

**Fiber Networks** 

When a link between two switches fails following the breakdown of the switch, the backup link will be activated. Data will then be transmitted via the backup path (see below).

**Fast Ethernet Networks** 

**Fiber Networks** 

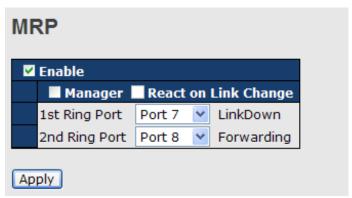

**Note**: The maximum cable length for copper ports is 100 meters and 20km for fiber ports. When data bypasses the inactive switch(s) to another active switch, the distance between the two active switches must be within the maximum length, otherwise transmission will fail.

## 4.5 MRP

#### 4.5.1 Introduction

MRP (Media Redundancy Protocol) is an industry standard for high-availability Ethernet networks. MRP allowing Ethernet switches in ring configuration to recover from failure rapidly to ensure seamless data transmission. A MRP ring (IEC 62439) can support up to 50 devices and will enable a back-up link in 80ms (adjustable to max. 200ms/500ms).

# 4.5.2 Configurations

Label	Description
Enable	Enables the MRP function
Manager	Every MRP topology needs a MRP manager. One MRP
	topology can only have a Manager. If two or more switches are

	set to be Manager, the MRP topology will fail.
React on Link Change	Faster mode. Enabling this function will cause MRP topology to
(Advanced mode)	converge more rapidly. This function only can be set in MRP
	manager switch.
1 <sup>st</sup> Ring Port	Chooses the port which connects to the MRP ring
2 <sup>nd</sup> Ring Port	Chooses the port which connects to the MRP ring

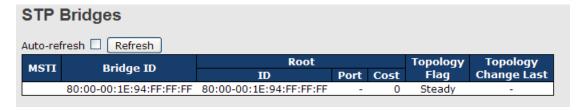

## 4.6 STP/RSTP/MSTP

#### **4.6.1 STP/RSTP**

STP (Spanning Tree Protocol), and its advanced versions RSTP (Rapid Spanning Tree Protocol) and MSTP (Multiple Spanning Tree Protocol), are designed to prevent network loops and provide network redundancy. Network loops occur frequently in large networks as when two or more paths run to the same destination, broadcast packets may get in to an infinite loop and hence causing congestion in the network. STP can identify the best path to the destination, and block all other paths. The blocked links will stay connected but inactive. When the best path fails, the blocked links will be activated. Compared to STP which recovers a link in 30 to 50 seconds, RSTP can shorten the time to 5 to 6 seconds.

#### **STP Bridge Status**

This page shows the status for all STP bridge instance.

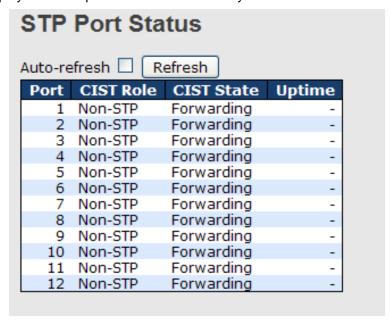

Label	Description
MSTI	The bridge instance. You can also link to the STP detailed
	bridge status.
Bridge ID	The bridge ID of this bridge instance.
Root ID	The bridge ID of the currently selected root bridge.
Root Port	The switch port currently assigned the root port role.
	Root path cost. For a root bridge, this is zero. For other bridges,
Root Cost	it is the sum of port path costs on the least cost path to the Root
	Bridge.
Topology Flag	The current state of the Topology Change Flag for the bridge

	instance.
Topology Change Last	The time since last Topology Change occurred.
Refresh	Click to refresh the page immediately.
Auto-refresh	Check this box to enable an automatic refresh of the page at
	regular intervals.

#### **STP Port Status**

This page displays the STP port status for the currently selected switch.

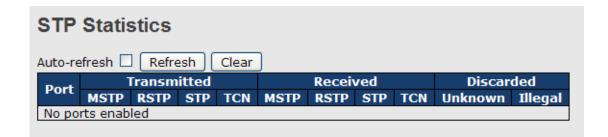

Label	Description
Port	The switch port number to which the following settings will be
	applied.
CIST Dala	The current STP port role of the CIST port. The values include:
CIST Role	AlternatePort, BackupPort, RootPort, and DesignatedPort.
State	The current STP port state of the CIST port. The values include:
	Blocking, Learning, and Forwarding.
Uptime	The time since the bridge port is last initialized
Refresh	Click to refresh the page immediately.
Auto-refresh	Check this box to enable an automatic refresh of the page at
	regular intervals.

#### **STP Statistics**

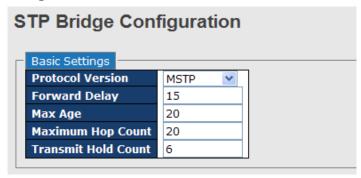

This page displays the STP port statistics for the currently selected switch.

Label	Description
Port	The switch port number to which the following settings will be
	applied.
DOTE	The number of RSTP configuration BPDUs received/transmitted
RSTP	on the port
et n	The number of legacy STP configuration BPDUs
STP	received/transmitted on the port
TCN	The number of (legacy) topology change notification BPDUs
	received/transmitted on the port
Discourded Huden com-	The number of unknown spanning tree BPDUs received (and
Discarded Unknown	discarded) on the port.
Discarded Illegal	The number of illegal spanning tree BPDUs received (and
	discarded) on the port.
Refresh	Click to refresh the page immediately
Auto-refresh	Check to enable an automatic refresh of the page at regular
	intervals

## **STP Bridge Configurations**

Label	Description
Protocol Version	The version of the STP protocol. Valid values include STP, RSTP
	and MSTP.
Forward Delay	The delay used by STP bridges to transit root and designated

	ports to forwarding (used in STP compatible mode). The range of
	valid values is 4 to 30 seconds.
	The maximum time the information transmitted by the root bridge
Max Age	is considered valid. The range of valid values is 6 to 40 seconds,
	and <b>Max Age</b> must be <= (FwdDelay-1)*2.
	This defines the initial value of remaining hops for MSTI
Maximum Hop Count	information generated at the boundary of an MSTI region. It
	defines how many bridges a root bridge can distribute its BPDU
	information to. The range of valid values is 4 to 30 seconds, and
	MaxAge must be <= (FwdDelay-1)*2.
	The number of BPDUs a bridge port can send per second. When
Transmit Hold Count	exceeded, transmission of the next BPDU will be delayed. The
	range of valid values is 1 to 10 BPDUs per second.
Save	Click to save changes.
Reset	Click to undo any changes made locally and revert to previously
	saved values.

#### 4.6.2 MSTP

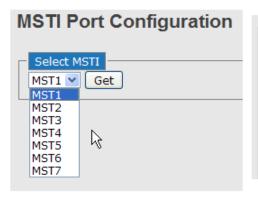

Since the recovery time of STP and RSTP takes seconds, which are unacceptable in some industrial applications, MSTP was developed. The technology supports multiple spanning trees within a network by grouping and mapping multiple VLANs into different spanning-tree instances, known as MSTIs, to form individual MST regions. Each switch is assigned to an MST region. Hence, each MST region consists of one or more MSTP switches with the same VLANs, at least one MST instance, and the same MST region name. Therefore, switches can use different paths in the network to effectively balance loads.

#### **Port Settings**

This page allows you to examine and change the configurations of current MSTI ports. A MSTI port is a virtual port, which is instantiated separately for each active CIST (physical) port for each MSTI instance configured and applicable for the port. The MSTI instance must be selected before MSTI port configuration options are displayed.

This page contains MSTI port settings for physical and aggregated ports. The aggregation settings are stack global.

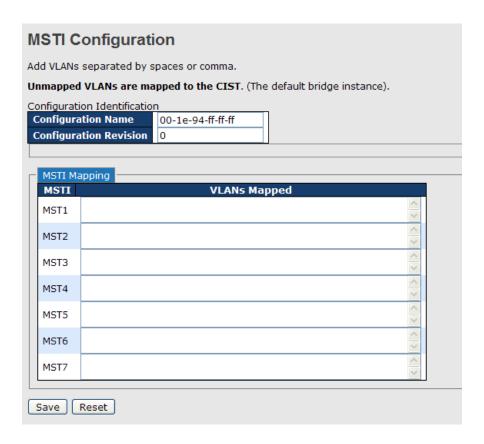

Label	Description
Port	The switch port number of the corresponding STP CIST (and MSTI)
	port
	Configures the path cost incurred by the port. Auto will set the path
	cost according to the physical link speed by using the
Path Cost	802.1D-recommended values. Specific allows you to enter a
	user-defined value. The path cost is used when establishing an
	active topology for the network. Lower path cost ports are chosen
	as forwarding ports in favor of higher path cost ports. The range of
	valid values is 1 to 200000000.
Priority	Configures the priority for ports having identical port costs. (See
	above).
Save	Click to save changes.
Reset	Click to undo any changes made locally and revert to previously
	saved values.

#### **Mapping**

This page allows you to examine and change the configurations of current STP MSTI bridge instance.

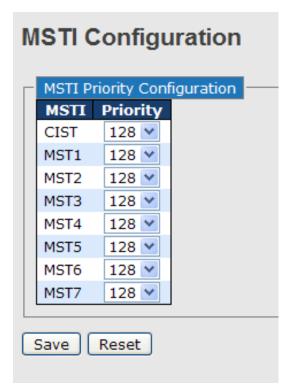

Label	Description
	The name which identifies the VLAN to MSTI mapping. Bridges
	must share the name and revision (see below), as well as the
Configuration Name	VLAN-to-MSTI mapping configurations in order to share spanning
	trees for MSTIs (intra-region). The name should not exceed 32
	characters.
Configuration	Revision of the MSTI configuration named above. This must be
Revision	an integer between 0 and 65535.
MSTI	The bridge instance. The CIST is not available for explicit
	mapping, as it will receive the VLANs not explicitly mapped.
	The list of VLANs mapped to the MSTI. The VLANs must be
\/I ANO Massas a I	separated with commas and/or space. A VLAN can only be
VLANS Mapped	mapped to one MSTI. An unused MSTI will be left empty (ex.
	without any mapped VLANs).
Save	Click to save changes.
Reset	Click to undo any changes made locally and revert to previously
	saved values.

#### **Priority**

This page allows you to examine and change the configurations of current STP MSTI bridge instance priority.

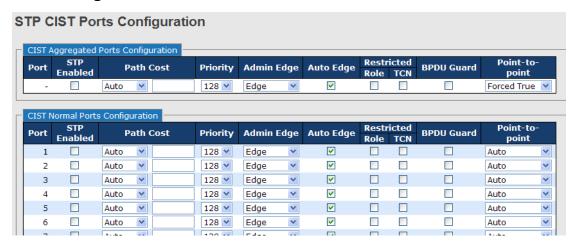

Label	Description
MSTI	The bridge instance. CIST is the default instance, which is always
	active.
Priority	Indicates bridge priority. The lower the value, the higher the
	priority. The bridge priority, MSTI instance number, and the 6-byte
	MAC address of the switch forms a bridge identifier.
Save	Click to save changes
Reset	Click to undo any changes made locally and revert to previously
	saved values

#### 4.6.3 CIST

With the ability to cross regional boundaries, CIST is used by MSTP to communicate with other MSTP regions and with any RSTP and STP single-instance spanning trees in the network. Any boundary port, that is, if it is connected to another region, will automatically belongs solely to CIST, even if it is assigned to an MSTI. All VLANs that are not members of particular MSTIs are members of the CIST.

### **Port Settings**

The switch port number to which the following settings will be applied.  STP Enabled  Check to enable STP for the port  Configures the path cost incurred by the port. Auto will set the path cost according to the physical link speed by using the 802.1D-recommended values. Specific allows you to enter a user-defined value. The path cost is used when establishing an active topology for the network. Lower path cost ports are chosen as forwarding ports in favor of higher path cost ports. The range of valid values is 1 to 200000000.  Priority  Configures the priority for ports having identical port costs. (See above).  A flag indicating whether the port is connected directly to edge devices or not (no bridges attached). Transiting to the forwarding state is faster for edge ports (operEdge set to true) than other ports.  AdminEdge  Configures the operEdge flag to start as set or cleared.(the initial operEdge state when a port is initialized).  Check to enable the bridge to detect edges at the bridge port automatically. This allows operEdge to be derived from whether BPDUs are received on the port or not.  When enabled, the port will not be selected as root port for CIST or any MSTI, even if it has the best spanning tree priority vector. Such a port will be selected as an alternate port after the root port	Label	Description
STP Enabled  Check to enable STP for the port  Configures the path cost incurred by the port. Auto will set the path cost according to the physical link speed by using the 802.1D-recommended values. 		Such a port will be selected as an alternate port after the root port

	<b>,</b>
	has been selected. If set, spanning trees will lose connectivity. It
	can be set by a network administrator to prevent bridges outside a
	core region of the network from influencing the active spanning
	tree topology because those bridges are not under the full control
	of the administrator. This feature is also known as Root Guard.
Restricted TCN	When enabled, the port will not propagate received topology
	change notifications and topology changes to other ports. If set, it
	will cause temporary disconnection after changes in an active
	spanning trees topology as a result of persistent incorrectly
	learned station location information. It is set by a network
	administrator to prevent bridges outside a core region of the
	network from causing address flushing in that region because
	those bridges are not under the full control of the administrator or
	is the physical link state for the attached LANs transitions
	frequently.
Point2Point	Configures whether the port connects to a point-to-point LAN
	rather than a shared medium. This can be configured
	automatically or set to true or false manually. Transiting to
	forwarding state is faster for point-to-point LANs than for shared
	media.
Save	Click to save changes.
Reset	Click to undo any changes made locally and revert to previously
	saved values.

# 4.7 Fast Recovery

Fast recovery mode can be set to connect multiple ports to one or more switches. The device with fast recovery mode will provide redundant links. Fast recovery mode supports 12 priorities. Only the first priority will be the active port, and the other ports with different priorities will be backup ports.

Label	Description
Active	Activate fast recovery mode
port	Ports can be set to 12 priorities. Only the port with the highest
	priority will be the active port. 1st Priority is the highest.
Apply	Click to activate the configurations.

# **M**anagement

The switch can be controlled via a built-in web server which supports Internet Explorer (Internet Explorer 5.0 or above versions) and other Web browsers such as Chrome. Therefore, you can manage and configure the switch easily and remotely. You can also upgrade firmware via a Web browser. The Web management function not only reduces network bandwidth consumption, but also enhances access speed and provides a user-friendly viewing screen.

**Note:** By default, IE5.0 or later version do not allow Java applets to open sockets. You need to modify the browser setting separately in order to enable Java applets for network ports.

#### Management via Web Browser

Follow the steps below to manage your switch via a Web browser

#### System Login

- 1. Launch an Internet Explorer.
- 2. Type http:// and the IP address of the switch. Press Enter.

- 3. A login screen appears.
- 4. Type in the username and password. The default username and password is admin.
- 5. Press **Enter** or click **OK**, the management page appears.

Note: you can use the following default values:

IP Address: **192.168.10.1** Subnet Mask: **255.255.255.0** 

Default Gateway: 192.168.10.254

User Name: admin
Password: admin

After logging in, you will see the information of the switch as below.

System	
Name	TGS-9200-M12-BP2
Description	EN50155 20-port managed Gigabit Ethernet switch with 20x10/100/1000Base-T(X),M12 connector and 2xbypass included
Location	
Contact	
OID	1.3.6.1.4.1.25972.100.6.0.223
Hardware	
MAC Address	00-1e-94-02-0c-18
Time	
System Date	1970-01-01 00:00:38+00:00
System Uptime	0d 00:00:38
Software	
Kernel Version	v9.21
Software Version	v1.00
Software Date	2014-10-21T14:36:52+08:00

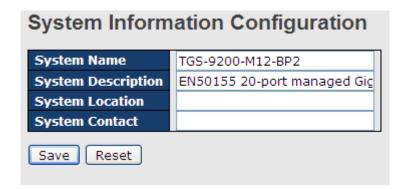

On the right hand side of the management interface shows links to various settings. Clicking on the links will bring you to individual configuration pages.

# 5.1 Basic Settings

The Basic Settings page allows you to configure the basic functions of the switch.

# 5.1.1 System Information

This page shows the general information of the switch.

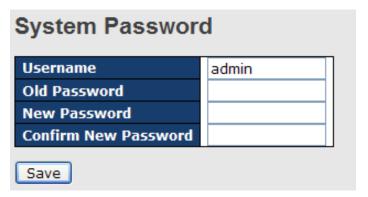

Label	Description
System Name	An administratively assigned name for the managed node. By

	convention, this is the node's fully-qualified domain name. A
	domain name is a text string consisting of alphabets (A-Z, a-z),
	digits (0-9), and minus sign (-). Space is not allowed to be part of
	the name. The first character must be an alpha character. And the
	first or last character must not be a minus sign. The allowed string
	length is 0 to 255.
System Description	Description of the device
	The physical location of the node (e.g., telephone closet, 3rd
System Location	floor). The allowed string length is 0 to 255, and only ASCII
	characters from 32 to 126 are allowed.
	The textual identification of the contact person for this managed
System Contact	node, together with information on how to contact this person.
System Contact	The allowed string length is 0 to 255, and only ASCII characters
	from 32 to 126 are allowed.
Save	Click to save changes.
Pacat	Click to undo any changes made locally and revert to previously
Reset	saved values.

## 5.1.2 Admin & Password

This page allows you to configure the system password required to access the web pages or log in from CLI.

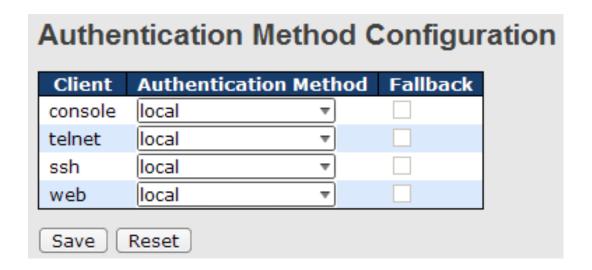

Label	Description	
Old Password	The existing password. If this is incorrect, you cannot set the new	
	password.	
New Password	The new system password. The allowed string length is 0 to 31,	
	and only ASCII characters from 32 to 126 are allowed.	
Confirm New	Do hand the new possessed	
Password	Re-type the new password.	

Save	Click to save changes.	
------	------------------------	--

#### 5.1.3 Authentication Methods

This page allows you to configure how a user is authenticated when he/she logs into the switch via one of the management interfaces.

Label	Description	
Client	The management client for which the configuration below applies.	
	Authentication Method can be set to one of the following values:	
Authentication	None: authentication is disabled and login is not possible.	
	Local: local user database on the switch is used for	
Method	authentication.	
	Radius: a remote RADIUS server is used for authentication.	
	Check to enable fallback to local authentication.	
Fallback	If none of the configured authentication servers are active, the	
	local user database is used for authentication.	
	This is only possible if Authentication Method is set to a value	
	other than <b>none</b> or <b>local</b> .	
Save	Click to save changes	
Reset	Click to undo any changes made locally and revert to previously	
	saved values	

# 5.1.4 IP Settings

This page allows you to configure IP information for the switch. You can specify configure the settings manually by disabling DHCP Client. After inputting the values, click **Renew** and the new values will be applied, which will be displayed under **Current**.

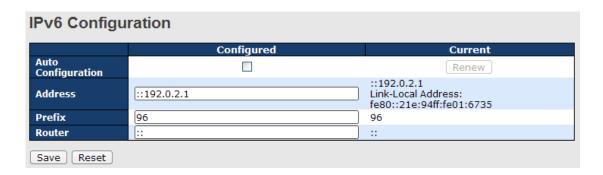

IP Configuration		
	Configured	Current
<b>DHCP Client</b>		Renew
IP Address	192.168.10.1	192.168.10.1
IP Mask	255.255.255.0	255.255.255.0
IP Router	0.0.0.0	0.0.0.0
VLAN ID	1	1
DNS Server	0.0.0.0	0.0.0.0

Label	Description
DHCP Client	Enable the DHCP client by checking this box. If DHCP fails or the
	configured IP address is zero, DHCP will retry. If DHCP retry fails,
	DHCP will stop trying and the configured IP settings will be used.
	Assigns the IP address of the network in use. If DHCP client
	function is enabled, you do not need to assign the IP address.
IP Address	The network DHCP server will assign an IP address to the switch
	and it will be displayed in this column. The default IP is
	192.168.10.1.
	Assigns the subnet mask of the IP address. If DHCP client
IP Mask	function is enabled, you do not need to assign the subnet mask.
IP Router	Assigns the network gateway for the switch. The default gateway
ir Routei	is <b>192.168.10.254</b> .
VI AN ID	Provides the managed VLAN ID. The allowed range is 1 through
VLAN ID	4095.
DNS Server	Enter the IP address of the DNS server in dotted decimal notation.
Save	Click to save changes
Doort	Click to undo any changes made locally and revert to previously
Reset	saved values

# 5.1.5 IPv6 Settings

IPv6 is the next-generation IP that uses a 128-bit address standard. It is developed to supplement, and eventually replace the IPv4 protocol. You can configure IPv6 information of the switch on the following page.

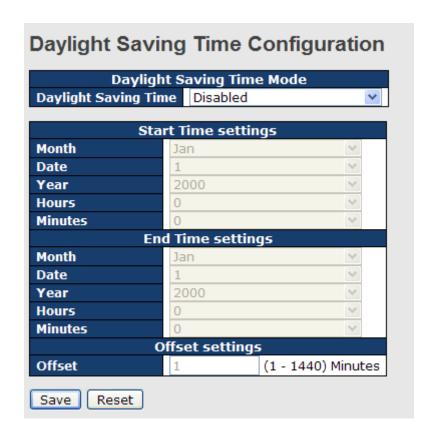

Label	Description
	Check to enable IPv6 auto-configuration. If the system cannot
	obtain the stateless address in time, the configured IPv6 settings
Auto Configuration	will be used. The router may delay responding to a router
	solicitation for a few seconds; therefore, the total time needed to
	complete auto-configuration may be much longer.
	Specify an IPv6 address for the switch. IPv6 address consists of
	128 bits represented as eight groups of four hexadecimal digits
	with a colon separating each field (:). For example, in
Address	'fe80::215:c5ff:fe03:4dc7', the symbol '::' is a special syntax that
Address	can be used as a shorthand way of representing multiple 16-bit
	groups of contiguous zeros; but it can appear only once. It can
	also represent a legally valid IPv4 address. For example,
	'::192.1.2.34'.
Prefix	Specify an IPv6 prefix for the switch. The allowed range is 1 to
	128.
	Specify an IPv6 address for the switch. IPv6 address consists of
	128 bits represented as eight groups of four hexadecimal digits
	with a colon separating each field (:). For example, in
Router	'fe80::215:c5ff:fe03:4dc7', the symbol '::' is a special syntax that
Koutei	can be used as a shorthand way of representing multiple 16-bit
	groups of contiguous zeros; but it can appear only once. It can
	also represent a legally valid IPv4 address. For example,
	'::192.1.2.34'.
Save	Click to save changes
Posot	Click to undo any changes made locally and revert to previously

#### 5.1.7 HTTPS

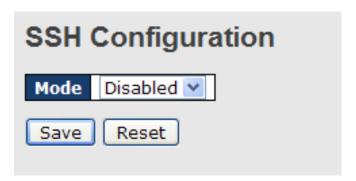

You can configure the HTTPS mode in the following page.

Label	Description
	Indicates the selected HTTPS mode. When the current
	connection is HTTPS, disabling HTTPS will automatically redirect
Mode	web browser to an HTTP connection. The modes include:
	Enabled: enable HTTPS.
	Disabled: disable HTTPS.
Save	Click to save changes
Beart	Click to undo any changes made locally and revert to previously
Reset	saved values

#### 5.1.8 SSH

SSH (Secure Shell) is a cryptographic network protocol intended for secure data transmission and remote access by creating a secure channel between two networked PCs. You can configure the SSH mode in the following page.

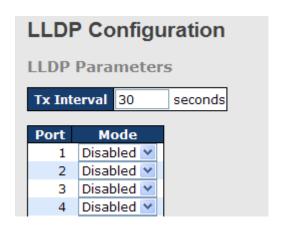

Label	Description
	Indicates the selected SSH mode. The modes include:
Mode	Enabled: enable SSH.
	Disabled: disable SSH.
Save	Click to save changes
Reset	Click to undo any changes made locally and revert to previously
	saved values

#### 5.1.9 LLDP

### **LLDP Configurations**

LLDP (Link Layer Discovery Protocol) provides a method for networked devices to receive and/or transmit their information to other connected devices on the network that are also using the protocols, and to store the information that is learned about other devices. This page allows you to examine and configure current LLDP port settings.

Label	Description
Port	The switch port number to which the following settings will be
Port	applied.
	Indicates the selected LLDP mode
	Rx only: the switch will not send out LLDP information, but LLDP
	information from its neighbors will be analyzed.
	Tx only: the switch will drop LLDP information received from its
Mode	neighbors, but will send out LLDP information.
	Disabled: the switch will not send out LLDP information, and will
	drop LLDP information received from its neighbors.
	Enabled: the switch will send out LLDP information, and will
	analyze LLDP information received from its neighbors.

#### **LLDP Neighbor Information**

This page provides a status overview for all LLDP neighbors. The following table contains information for each port on which an LLDP neighbor is detected. The columns include the following information:

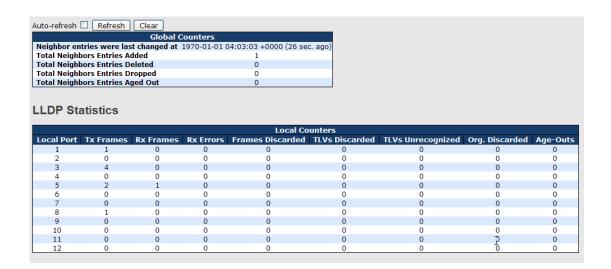

Label	Description
Local Port	The port that you use to transmits and receives LLDP frames.
Chassis ID	The identification number of the neighbor sending out the LLDP
	frames.
Remote Port ID	The identification of the neighbor port
System Name	The name advertised by the neighbor.
Port Description	The description of the port advertised by the neighbor.
	Description of the neighbor's capabilities. The capabilities include:
	1. Other
	2. Repeater
	3. Bridge
	4. WLAN Access Point
System Capabilities	5. Router
System Capabilities	6. Telephone
	7. DOCSIS Cable Device
	8. Station Only
	9. Reserved
	When a capability is enabled, a (+) will be displayed. If the
	capability is disabled, a (-) will be displayed.
Management	The neighbor's address which can be used to help network
Address	management. This may contain the neighbor's IP address.
Refresh	Click to refresh the page immediately
Auto-refresh	Check to enable an automatic refresh of the page at regular
Auto-lellesii	intervals

#### **Port Statistics**

This page provides an overview of all LLDP traffic. Two types of counters are shown. Global counters will apply settings to the whole switch stack, while local counters will apply settings to specified switches.

### **Global Counters**

Label	Description
Neighbor entries	Shows the time when the last entry was deleted or added.
were last changed at	
Total Neighbors	Shows the number of new entries added since switch reboot
Entries Added	
Total Neighbors	Shows the number of new entries deleted since switch reboot
Entries Deleted	
Total Neighbors	Shows the number of LLDP frames dropped due to full entry table
<b>Entries Dropped</b>	
Total Neighbors	Change the animal or of contrine deleted due to agriculture to live
Entries Aged Out	Shows the number of entries deleted due to expired time-to-live

#### **Local Counters**

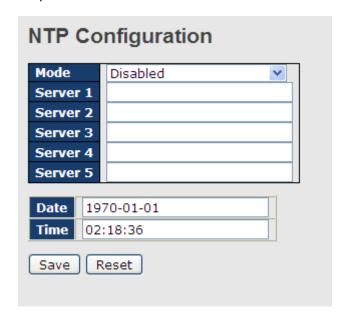

Label	Description
Local Port	The port that receives or transmits LLDP frames
Tx Frames	The number of LLDP frames transmitted on the port
Rx Frames	The number of LLDP frames received on the port
Rx Errors	The number of received LLDP frames containing errors
	If a port receives an LLDP frame, and the switch's internal table is
	full, the LLDP frame will be counted and discarded. This situation
Frames Discarded	is known as "too many neighbors" in the LLDP standard. LLDP
Frames Discarded	frames require a new entry in the table if Chassis ID or Remote
	Port ID is not included in the table. Entries are removed from the
	table when a given port links down, an LLDP shutdown frame is

	received, or when the entry ages out.
	Each LLDP frame can contain multiple pieces of information,
TLVs Discarded	known as TLVs (Type Length Value). If a TLV is malformed, it will
	be counted and discarded.
TLVs Unrecognized	The number of well-formed TLVs, but with an unknown type value
Org. Discarded	The number of organizationally TLVs received
	Each LLDP frame contains information about how long the LLDP
	information is valid (age-out time). If no new LLDP frame is
Age-Outs	received during the age-out time, the LLDP information will be
	removed, and the value of the age-out counter will be
	incremented.
Refresh	Click to refresh the page immediately
	Click to clear the local counters. All counters (including global
Clear	counters) are cleared upon reboot.
Auda mafina ali	Check to enable an automatic refresh of the page at regular
Auto-refresh	intervals

# 5.1.10 NTP

Network Time Protocol (NTP) is a networking protocol for clock synchronization between computer systems over packet-switched

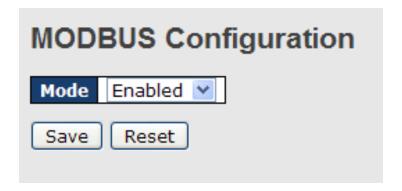

Label	Description
Mode	Indicates the NTP mode operation. Possible modes are:

	Enabled: Enable NTP client mode operation.
	Disabled: Disable NTP clinet mode operation.
	Provide the IPv4 or IPv6 address of a NTP server. IPv6 address is
	in 128-bit records represented as eight fields of up to four
	hexadecimal digits with a colon separating each field (:). For
Sorver	example, 'fe80::215:c5ff:fe03:4dc7'. The symbol '::' is a special
Server	syntax that can be used as a shorthand way of representing
	multiple 16-bit groups of contiguous zeros; but it can appear only
	once. It can also represent a legally valid IPv4 address. For
	example, '::192.1.2.34'.
Date	Show date value
Time	Show time value

#### 5.1.11 Modbus TCP

Modbus TCP uses TCP/IP and Ethernet to carry the data of the Modbus message structure between compatible devices. The protocol is commonly used in SCADA systems for communications between a human-machine interface (HMI) and programmable logic controllers. This page enables you to enable and disable Modbus TCP support of the switch.

Label	Description
Mode	Shows the existing status of the Modbus TCP function

# **5.1.12 Backup/Restore Configurations**

You can save/view or load switch configurations. The configuration file is in XML format.

# Configuration Save

Save configuration

Configuration Upload	
	<b>製質</b> Upload

# 5.1.13 Firmware Update

This page allows you to update the firmware of the switch.

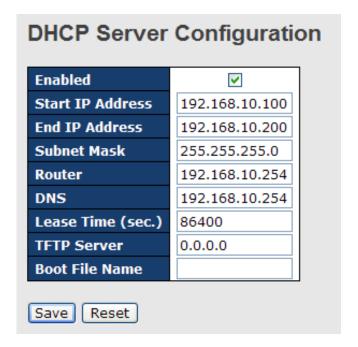

# 5.2 DHCP Server

The switch provides DHCP server functions. By enabling DHCP, the switch will become a DHCP server and dynamically assigns IP addresses and related IP information to network clients.

# 5.2.1 Basic Settings

This page allows you to set up DHCP settings for the switch. You can check the **Enabled** checkbox to activate the function. Once the box is checked, you will be able to input information in each column.

# 5.2.2 Dynamic Client List

When DHCP server functions are activated, the switch will collect DHCP client information and display in the following table. You can select the entries and add them to a static table by clicking **Add to static Table**.

#### 5.2.3 Client List

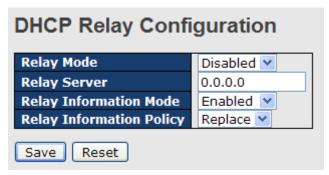

You can assign a specific IP address within the dynamic IP range to a specific port. When a device is connected to the port and requests for dynamic IP assigning, the switch will assign the IP address that has previously been assigned to the connected device.

# 5.2.4 Relay Agent

DHCP relay is used to forward and transfer DHCP messages between the clients and the server when they are not in the same subnet domain. You can configure the function in this page.

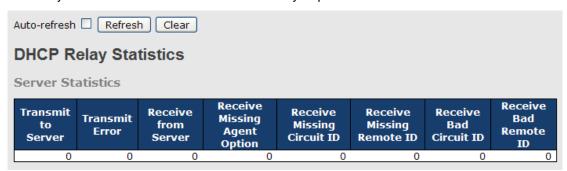

Label	Description
Relay Mode	Indicates the existing DHCP relay mode. The modes include:
	Enabled: activate DHCP relay. When DHCP relay is enabled, the
	agent forwards and transfers DHCP messages between the clients
	and the server when they are not in the same subnet domain to
	prevent the DHCP broadcast message from flooding for security
	considerations.
	Disabled: disable DHCP relay
Relay Server	Indicates the DHCP relay server IP address. A DHCP relay agent is
	used to forward and transfer DHCP messages between the clients
	and the server when they are not in the same subnet domain.
Relay Information	Indicates the existing DHCP relay information mode. The format of
Mode	DHCP option 82 circuit ID format is "[vlan_id][module_id][port_no]".
	The first four characters represent the VLAN ID, and the fifth and
	sixth characters are the module ID. In stand-alone devices, the
	module ID always equals to 0; in stacked devices, it means switch
	ID. The last two characters are the port number. For example,
	"00030108" means the DHCP message received form VLAN ID 3,
	switch ID 1, and port No. 8. The option 82 remote ID value equals
	to the switch MAC address.
	The modes include:
	Enabled: activate DHCP relay information. When DHCP relay
	information is enabled, the agent inserts specific information
	(option 82) into a DHCP message when forwarding to a DHCP
	server and removes it from a DHCP message when transferring to

	a DHCP client. It only works when DHCP relay mode is enabled.
	Disabled: disable DHCP relay information
Relay Information	Indicates the policies to be enforced when receiving DHCP relay
Policy	information. When DHCP relay information mode is enabled, if the
	agent receives a DHCP message that already contains relay agent
	information, it will enforce the policy. The Replace option is invalid
	when relay information mode is disabled. The policies includes:
	Replace: replace the original relay information when a DHCP
	message containing the information is received.
	Keep: keep the original relay information when a DHCP message
	containing the information is received.
	Drop: drop the package when a DHCP message containing the
	information is received.

The relay statistics shows the information of relayed packets of the switch.

Label	Description
Transmit to Sever	The number of packets relayed from the client to the server
Transmit Error	The number of packets with errors when being sent to clients
Receive from Server	The number of packets received from the server
Receive Missing Agent	The number of packets received without agent information
Option	
Receive Missing Circuit	The number of packets received with Circuit ID
ID	
Receive Missing	The number of packets received with the Remote ID option
Remote ID	missing.
Receive Bad Circuit ID	The number of packets whose Circuit ID do not match the
	known circuit ID
Receive Bad Remote ID	The number of packets whose Remote ID do not match the
	known Remote ID

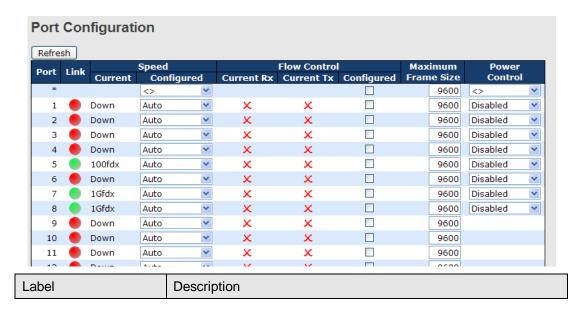

Label	Description
Transmit to Client	The number of packets relayed from the server to the client
Transmit Error	The number of packets with errors when being sent to servers
Receive from Client	The number of packets received from the server
Receive Agent Option	The number of received packets containing relay agent
	information
Replace Agent Option	The number of packets replaced when received messages
	contain relay agent information.
Keep Agent Option	The number of packets whose relay agent information is
	retained
<b>Drop Agent Option</b>	The number of packets dropped when received messages
	contain relay agent information.

# 5.3 Port Setting

Port Setting allows you to manage individual ports of the switch, including traffic, power, and trunks.

#### 5.3.1 Port Control

This page shows current port configurations. Ports can also be configured here.

	The south and continue to the first of the continue of the con
Port	The switch port number to which the following settings will be
	applied.
Link	The current link state is shown by different colors. Green indicates
	the link is up and red means the link is down.
Current Link Speed	Indicates the current link speed of the port
	The drop-down list provides available link speed options for a
Configured Link	given switch port
Speed	Auto selects the highest speed supported by the link partner
Speed	Disabled disables switch port configuration
	<> configures all ports
	When Auto is selected for the speed, the flow control will be
	negotiated to the capacity advertised by the link partner.
	When a fixed-speed setting is selected, that is what is used.
	Current Rx indicates whether pause frames on the port are
Flow Control	obeyed, and Current Tx indicates whether pause frames on the
	port are transmitted. The Rx and Tx settings are determined by
	the result of the last auto-negotiation.
	You can check the Configured column to use flow control. This
	setting is related to the setting of Configured Link Speed.
	You can enter the maximum frame size allowed for the switch port
Maximum Frame	in this column, including FCS. The allowed range is 1518 bytes to
	9600 bytes.
	Shows the current power consumption of each port in percentage.
	The Configured column allows you to change power saving
	parameters for each port.
Power Control	Disabled: all power savings functions are disabled
	ActiPHY: link down and power savings enabled
	PerfectReach: link up and power savings enabled
	Enabled: both link up and link down power savings enabled
Total Power Usage	Total power consumption of the board, measured in percentage
Save	Click to save changes
_	Click to undo any changes made locally and revert to previously
Reset	saved values
<u> </u>	Click to refresh the page. Any changes made locally will be
Refresh	undone.
	1

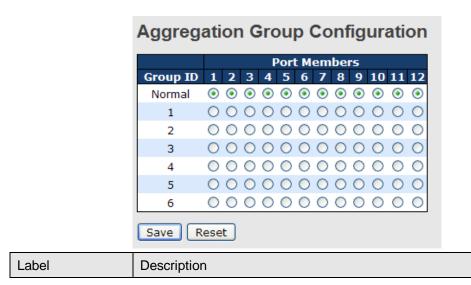

# 5.3.2 Port Trunk

A port trunk is a group of ports that have been grouped together to function as one logical path. This method provides an economical way for you to increase the bandwidth between the switch and another networking device. In addition, it is useful when a single physical link between the devices is insufficient to handle the traffic load. This page allows you to configure the aggregation hash mode and the aggregation group.

Aggregation Mode Configuration		
Hash Code Contribute	ors	
Source MAC Address	<b>~</b>	
Destination MAC Address		
<u>I</u> P Address	<b>~</b>	
TCP/UDP Port Number	<b>~</b>	

Label	Description
Source MAC Address	Calculates the destination port of the frame. You can check this
	box to enable the source MAC address, or uncheck to disable. By
	default, Source MAC Address is enabled.
Destination MAC	Calculates the destination port of the frame. You can check this
Address	box to enable the destination MAC address, or uncheck to
	disable. By default, <b>Destination MAC Address</b> is disabled.
IP Address	Calculates the destination port of the frame. You can check this
	box to enable the IP address, or uncheck to disable. By default, IP
	Address is enabled.
TCP/UDP Port	Calculates the destination port of the frame. You can check this
Number	box to enable the TCP/UDP port number, or uncheck to disable.
	By default, TCP/UDP Port Number is enabled.

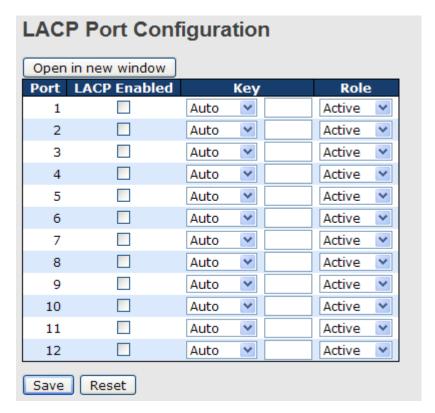

Group ID	Indicates the ID of each aggregation group. Normal means no
	aggregation. Only one group ID is valid per port.
Port Members	Lists each switch port for each group ID. Select a radio button to
	include a port in an aggregation, or clear the radio button to remove
	the port from the aggregation. By default, no ports belong to any
	aggregation group. Only full duplex ports can join an aggregation and
	the ports must be in the same speed in each group.

#### 5.3.3 LACP

LACP (Link Aggregation Control Protocol) trunks are similar to static port trunks, but they are more flexible because LACP is compliant with the IEEE 802.3ad standard. Hence, it is interoperable with equipment from other vendors that also comply with the standard. This page allows you to enable LACP functions to group ports together to form single virtual links and change associated settings, thereby increasing the bandwidth between the switch and other LACP-compatible devices.

Label	Description
Port	Indicates the ID of each aggregation group. Normal indicates there is
	no aggregation. Only one group ID is valid per port.
LACP Enabled	Lists each switch port for each group ID. Check to include a port in an

	aggregation, or clear the box to remove the port from the aggregation.
	By default, no ports belong to any aggregation group. Only full duplex
	ports can join an aggregation and the ports must be in the same speed
	in each group.
Key	The <b>Key</b> value varies with the port, ranging from 1 to 65535. <b>Auto</b> will
	set the key according to the physical link speed ( $10Mb = 1$ , $100Mb = 2$ ,
	1Gb = 3). <b>Specific</b> allows you to enter a user-defined value. Ports with
	the same key value can join in the same aggregation group, while
	ports with different keys cannot.
Role	Indicates LACP activity status. Active will transmit LACP packets
	every second, while Passive will wait for a LACP packet from a partner
	(speak if spoken to).
Save	Click to save changes
Reset	Click to undo changes made locally and revert to previous values

# **LACP System Status**

This page provides a status overview for all LACP instances.

Label	Description	
Aggr ID	The aggregation ID is associated with the aggregation instance.	
	For LLAG, the ID is shown as 'isid:aggr-id' and for GLAGs as	
	'aggr-id'	
Partner System ID	System ID (MAC address) of the aggregation partner	
Partner Key	The key assigned by the partner to the aggregation ID	
Last Changed	The time since this aggregation changed.	
Last Changed	Indicates which ports belong to the aggregation of the	
	switch/stack. The format is: "Switch ID:Port".	
Refresh	Click to refresh the page immediately	
Auto-refresh	Check to enable an automatic refresh of the page at regular	
	intervals	

#### **LACP Status**

This page provides an overview of the LACP status for all ports.

LACP Status					
Auto-re	Auto-refresh Refresh Open in new window				
Port	LACP	Key	Aggr ID	Partner System ID	Partner Port
1	No	-	-	-	-
2	No	-	-	-	-
3	No	-	-	-	-
4	No	-	-	-	-
5	No	-	-	-	-
6	No	-	-	-	-
7	No	-	-	-	-
8	No	-	-	-	-
9	No	-	-	-	-
10	No	-	-	-	-
11	No	-	-	-	-
12	No	-	-	-	-

Label	Description	
Port	Switch port number	
LACP	Yes means LACP is enabled and the port link is up. No means	
	LACP is not enabled or the port link is down. Backup means the	
	port cannot join in the aggregation group unless other ports are	
	removed. The LACP status is disabled.	
Key	The key assigned to the port. Only ports with the same key can be	
	aggregated	
Aggr ID	The aggregation ID assigned to the aggregation group	
Partner System ID The partner's system ID (MAC address)		
Partner Port	The partner's port number associated with the port	
Refresh	Click to refresh the page immediately	
Auto-refresh	Check to enable an automatic refresh of the page at regular	
Auto-renesn	intervals	

# **LACP Statistics**

This page provides an overview of the LACP statistics for all ports.

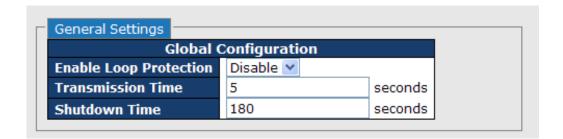

LACP Statistics				
Auto-re	fresh 🗌 Refre	esh Clear	]	
Port	LACP	LACP	Discar	
PUIL	Transmitted	Received	Unknown	Illegal
1	0	0	0	0

3	0	0	0	0
4	0	0	0	0
5	0	0	0	0
6	0	0	0	0
7	0	0	0	0
8	0	0	0	0
9	0	0	0	0
10	0	0	0	0
11	0	0	0	0
12	0	0	0	0

Label	Description	
Port	Switch port number	
LACP Transmitted	The number of LACP frames sent from each port	
LACP Received	The number of LACP frames received at each port	
Discarded	The number of unknown or illegal LACP frames discarded at each	
	port.	
Refresh	Click to refresh the page immediately	
Auto-refresh	Check to enable an automatic refresh of the page at regular	
Auto-renesn	intervals	
Clear	Click to clear the counters for all ports	

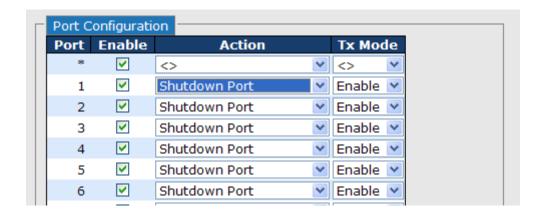

# 5.3.4 Loop Gourd

This feature prevents loop attack. When receiving loop packets, the port will be disabled automatically, preventing the loop attack from affecting other network devices.

Label	Description		
<b>Enable Loop Protection</b>	Activate loop protection functions (as a whole)		
Transmission Time	The interval between each loop protection PDU sent on each		
	port. The valid value is 1 to 10 seconds.		
Shutdown Time	The period (in seconds) for which a port will be kept disabled		
	when a loop is detected (shutting down the port). The valid		
	value is 0 to 604800 seconds (7 days). A value of zero will		
	keep a port disabled permanently (until the device is		
	restarted).		

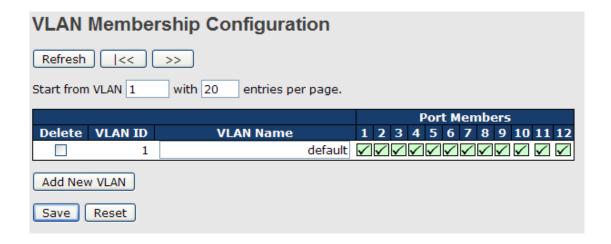

Label	Description	
Port	Switch port number	
Enable	Activate loop protection functions (as a whole)	
Action	Configures the action to take when a loop is detected. Valid	
	values include Shutdown Port, Shutdown Port, and Log or	
	Log Only.	
Tx Mode	Controls whether the port is actively generating loop protection	
	PDUs or only passively look for looped PDUs.	

# **5.4 VLAN**

## 5.4.1 VLAN Membership

A VLAN is a group of end devices with a common set of requirements, independent of physical location. With the same attributes as a physical LAN, VLANs enable you to group end devices even if they are not located physically on the same LAN segment. By splitting up a network into sets of VLANs, assigning ports to individual VLANs, and defining criteria for VLAN membership for workstations connected to those ports, traffic for the same VLAN can be sent between switches.

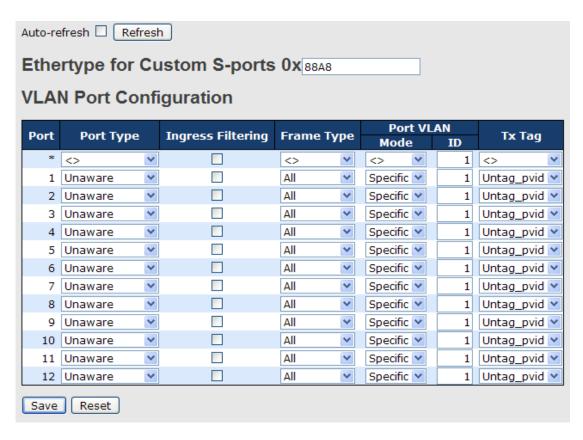

Label	Description	
Delete	Check to delete the entry. It will be deleted during the next	
Delete	save.	
VLAN ID	The VLAN ID for a tagged port.	
VLAN Name	The name of the VLAN.	
Port Members	Check to select the ports belonging to individual VLAN.	
	Click to add a new VLAN ID. An empty row is added to the	
	table, and the VLAN can be configured as needed. Valid	
	values for a VLAN ID are 1 through 4095.	
Add New VLAN	After clicking Save, the new VLAN will be enabled on the	
Add New YLAN	selected switch stack but contains no port members.	
	A VLAN without any port members on any stack will be	
	deleted when you click Save.	
	Click <b>Delete</b> to undo the addition of new VLANs.	

## **5.4.2 Port Configurations**

With port-based VLANs, the ports of a switch are simply assigned to VLANs, with no extra criteria. All devices connected to a given port automatically become members of the VLAN to which that port was assigned. In effect, this just divides a switch up into a set of independent sub-switches.

Label	Description			
	This field specifies the Ethertype used for custom S-ports. This is			
	a global setting for all custom S-ports. Custom Ethertype enables			
	you to change the Ethertype value on a port to any value to			
Ethartuna far	support network devices that do not use the standard 0x8100			
Ethertype for	Ethertype field value on 802.1Q-tagged or 802.1p-tagged frames.			
customer S-Ports	When Port Type is set to S-custom-port, the EtherType (also			
	known as TPID) of all frames received on the port is changed to			
	the specified value. By default, the EtherType is set to 0x88a8			
	(IEEE 802.1ad)			
Port	The switch port to which the following settings will be applied.			
	Port can be one of the following types: Unaware, Customer			
Port type	(C-port), Service (S-port), Custom Service (S-custom-port).			
	C-port: each frame is assigned to the VLAN indicated in the			

	VLAN tag, and the tag is removed.
	S-port: the EtherType of all received frames is changed to
	0x88a8 to indicate that double-tagged frames are being
	forwarded across the switch. The switch will pass these frames on
	·
	to the VLAN indicated in the outer tag. It will not strip the outer
	tag, nor change any components of the tag other than the
	EtherType field.
	S-custom-port: the EtherType of all received frames is changed
	to value set in the Ethertype for Custom S-ports field to indicate
	that double-tagged frames are being forwarded across the switch.
	The switch will pass these frames on to the VLAN indicated in the
	outer tag. It will not strip the outer tag, nor change any
	components of the tag other than the EtherType field.
	Unaware: all frames are classified to the Port VLAN ID and tags
	are not removed
	Enable ingress filtering on a port by checking the box. This
	parameter affects VLAN ingress processing. If ingress filtering is
Ingress Filtering	enabled and the ingress port is not a member of the classified
	VLAN of the frame, the frame will be discarded. By default,
	ingress filtering is disabled (no check mark).
	Determines whether the port accepts all frames or only
	tagged/untagged frames. This parameter affects VLAN ingress
Frame Type	processing. If the port only accepts tagged frames, untagged
	frames received on the port will be discarded. By default, the field
	is set to All.
	The allowed values are <b>None</b> or <b>Specific</b> . This parameter affects
	VLAN ingress and egress processing.
	If None is selected, a VLAN tag with the classified VLAN ID is
	inserted in frames transmitted on the port. This mode is normally
	used for ports connected to VLAN-aware switches. Tx tag should
	be set to Untag_pvid when this mode is used.
Port VLAN Mode	If <b>Specific</b> (the default value) is selected, a port VLAN ID can be
	configured (see below). Untagged frames received on the port are
	classified to the port VLAN ID. If VLAN awareness is disabled, all
	frames received on the port are classified to the port VLAN ID. If
	the classified VLAN ID of a frame transmitted on the port is
	different from the port VLAN ID, a VLAN tag with the classified

	VLAN ID will be inserted in the frame.		
	Configures the VLAN identifier for the port. The allowed range of		
Port VLAN ID	the values is 1 through 4095. The default value is 1.		
POR VLAN ID	Note: The port must be a member of the same VLAN as the port		
	VLAN ID.		
	Determines egress tagging of a port. Untag_pvid: all VLANs		
Tx Tag	except the configured PVID will be tagged. Tag_all: all VLANs are		
	tagged. <b>Untag_all</b> : all VLANs are untagged.		

# **Introduction of Port Types**

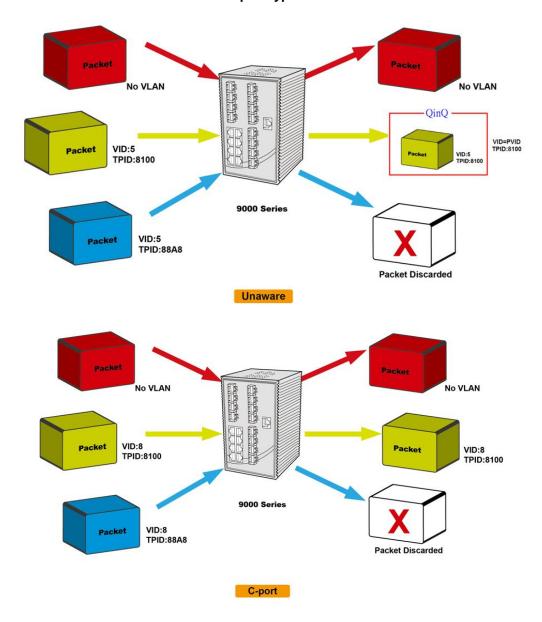

Below is a detailed description of each port type, including Unaware, C-port, S-port, and S-custom-port.

	Ingress action	Egress action
Unaware	When the port receives untagged frames, an	The TPID of a frame
The function of	untagged frame obtains a tag (based on PVID)	transmitted by
Unaware can	and is forwarded.	Unaware port will be
be used for	When the port receives tagged frames:	set to 0x8100.
802.1QinQ	1. If the tagged frame contains a TPID of	The final status of the
(double tag).	0x8100, it will become a double-tag frame and	frame after egressing
	will be forwarded.	will also be affected by
	2. If the TPID of tagged frame is not 0x8100	the Egress Rule.
	(ex. 0x88A8), it will be discarded.	
C-port	When the port receives untagged frames, an	The TPID of a frame
	untagged frame obtains a tag (based on PVID)	transmitted by C-port
	and is forwarded.	will be set to 0x8100.
	When the port receives tagged frames:	
	1. If the tagged frame contains a TPID of	
	0x8100, it will be forwarded.	
	2. If the TPID of tagged frame is not 0x8100	
	(ex. 0x88A8), it will be discarded.	
S-port	When the port receives untagged frames, an	The TPID of a frame
	untagged frame obtains a tag (based on PVID)	transmitted by S-port
	and is forwarded.	will be set to 0x88A8.
	When the port receives tagged frames:	
	1. If the tagged frame contains a TPID of	
	0x8100, it will be forwarded.	

	2. If the TPID of tagged frame is not 0x88A8	
	(ex. 0x8100), it will be discarded.	
S-custom-port	When the port receives untagged frames, an	The TPID of a frame
	untagged frame obtains a tag (based on PVID)	transmitted by
	and is forwarded.	S-custom-port will be
	When the port receives tagged frames:	set to a
	1. If the tagged frame contains a TPID of	self-customized value,
	0x8100, it will be forwarded.	which can be set by
	2. If the TPID of tagged frame is not 0x88A8	the user via <b>Ethertype</b>
	(ex. 0x8100), it will be discarded.	for Custom S-ports.

# Below are the illustrations of different port types:

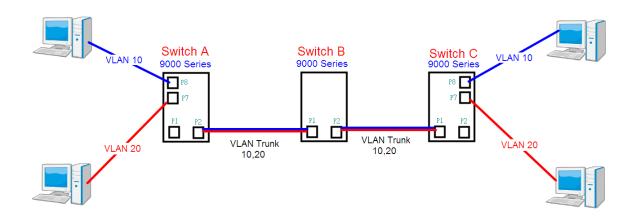

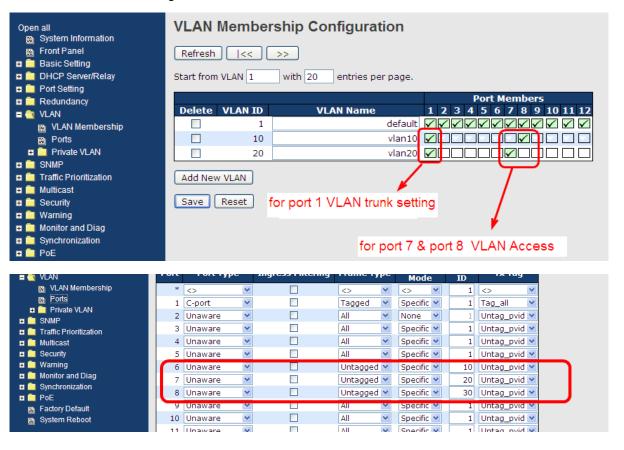

# Examples of VLAN Settings VLAN Access Mode:

#### Switch A.

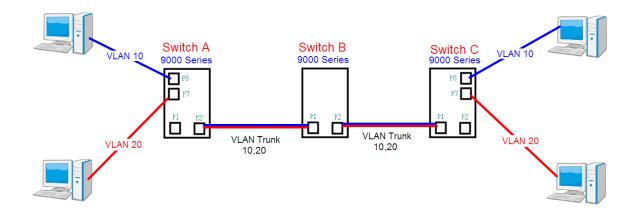

Port 7 is VLAN Access mode = Untagged 20 Port 8 is VLAN Access mode = Untagged 10

Below are the switch settings.

#### **VLAN 1Q Trunk Mode:**

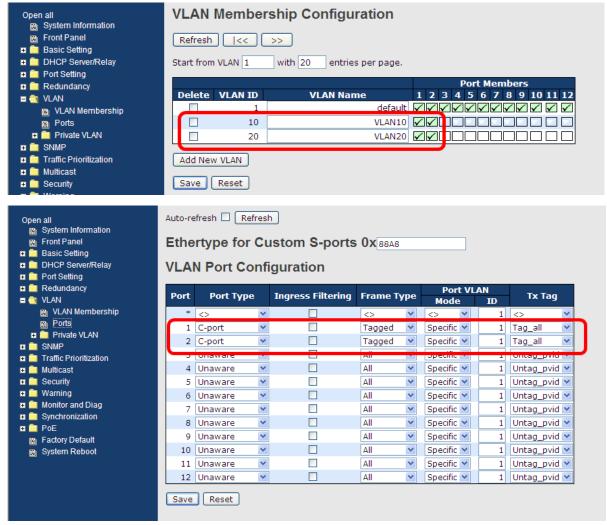

#### Switch B.

Port 1 = VLAN 1Qtrunk mode = tagged 10, 20

Port 2 = VLAN 1Qtrunk mode = tagged 10, 20

#### Below are the switch settings.

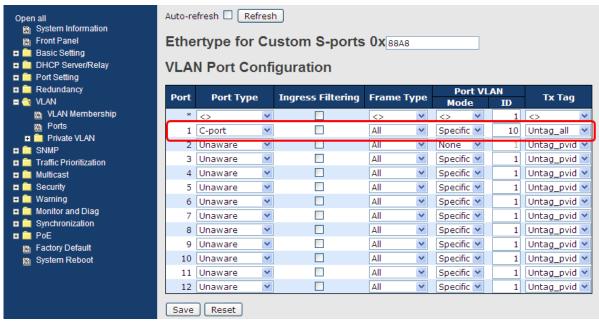

#### **VLAN Hybrid Mode:**

Port 1 VLAN Hybrid mode = untagged 10 Tagged 10, 20

Below are the switch settings.

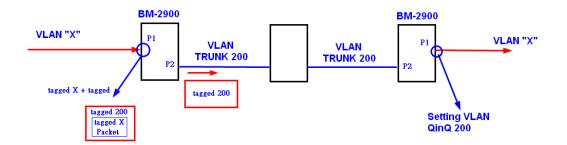

#### **VLAN QinQ Mode:**

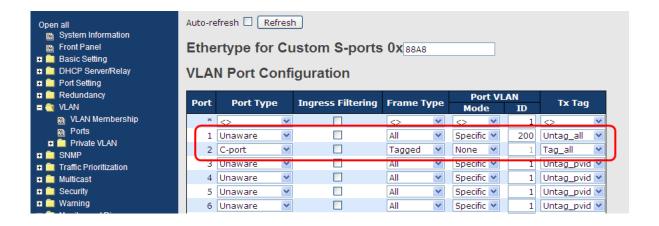

VLAN QinQ mode is usually adopted when there are unknown VLANs, as shown in the figure below.

#### VLAN "X" = Unknown VLAN

#### 9000 Series Port 1 VLAN Settings:

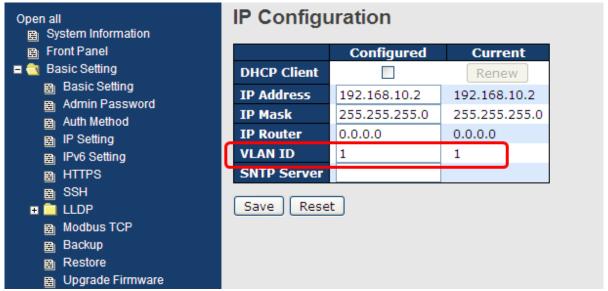

#### **VLAN ID Settings**

When setting the management VLAN, only the same VLAN ID port can be used to control the switch.

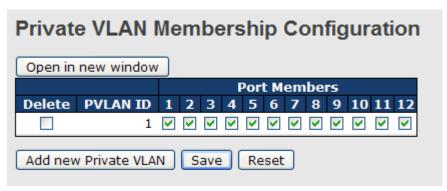

#### 9000 Series VLAN Settings:

#### 5.4.3 Private VLAN

A private VLAN contains switch ports that can only communicate with a given "uplink". The restricted ports are called private ports. Each private VLAN typically contains many private ports and a single uplink. The switch forwards all frames received on a private port out the uplink port, regardless of VLAN ID or destination MAC address. A port must be a member of both a VLAN and a private VLAN to be able to forward packets. This page allows you to configure private VLAN memberships for the switch. By default, all ports are VLAN unaware and members of VLAN 1 and private VLAN 1.

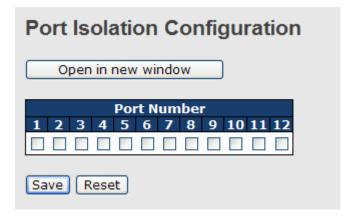

Label	Description	
Delete	Check to delete the entry. It will be deleted during the next save.	
Private VLAN ID	Indicates the ID of this particular private VLAN.	
MAC Address	The MAC address for the entry.	
Port Members	A row of check boxes for each port is displayed for each private	
	VLAN ID. You can check the box to include a port in a private	

	VLAN. To remove or exclude the port from the private VLAN,	
	VLAN. To remove or exclude the port from the private VLAN,	
	make sure the box is unchecked. By default, no ports are	
	members, and all boxes are unchecked.	
	Click <b>Add new Private VLAN</b> to add a new private VLAN ID. An	
	empty row is added to the table, and the private VLAN can be	
	configured as needed. The allowed range for a private VLAN ID is	
	the same as the switch port number range. Any values outside	
Adding a New Static	this range are not accepted, and a warning message appears.	
Entry	Click OK to discard the incorrect entry, or click Cancel to return to	
	the editing and make a correction.	
	The private VLAN is enabled when you click Save.	
	The <b>Delete</b> button can be used to undo the addition of new	
	private VLANs.	

A private VLAN is defined as a pairing of a primary VLAN with a secondary VLAN. A promiscuous port is a port that can communicate with all other private VLAN port types via the primary VLAN and any associated secondary VLANs, whereas isolated ports can communicate only with a promiscuous port.

Label	Description	
	A check box is provided for each port of a private VLAN.	
Port Members	When checked, port isolation is enabled for that port.	
	When unchecked, port isolation is disabled for that port.	
	By default, port isolation is disabled for all ports.	

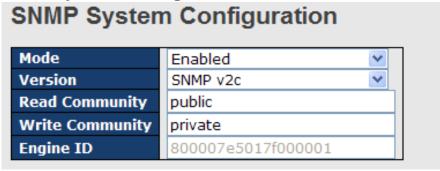

# **5.5 SNMP**

SNMP (Simple Network Management Protocol) is a protocol for managing devices on IP networks. It is mainly used network management systems to monitor the operational status of

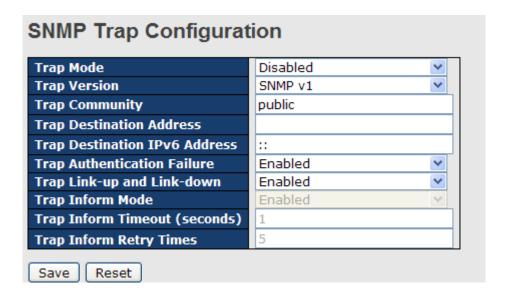

networked devices. In an event-triggered situation, traps and notifications will be sent to administrators.

## **5.5.1 SNMP System Configurations**

Label	Description	
	Indicates existing SNMP mode. Possible modes include:	
Mode	Enabled: enable SNMP mode	
	Disabled: disable SNMP mode	
	Indicates the supported SNMP version. Possible versions include:	
Version	SNMP v1: supports SNMP version 1.	
version	SNMP v2c: supports SNMP version 2c.	
	SNMP v3: supports SNMP version 3.	
	Indicates the read community string to permit access to SNMP agent.	
	The allowed string length is 0 to 255, and only ASCII characters from	
Read Community	33 to 126 are allowed.	
Read Community	The field only suits to SNMPv1 and SNMPv2c. SNMPv3 uses USM	
	for authentication and privacy and the community string will be	
	associated with SNMPv3 community table.	
	Indicates the write community string to permit access to SNMP	
	agent. The allowed string length is 0 to 255, and only ASCII	
Write Community	characters from 33 to 126 are allowed.	
write Community	The field only suits to SNMPv1 and SNMPv2c. SNMPv3 uses USM	
	for authentication and privacy and the community string will be	
	associated with SNMPv3 community table.	
Engine ID	Indicates the SNMPv3 engine ID. The string must contain an even	
	number between 10 and 64 hexadecimal digits, but all-zeros and	
Engine ID	all-'F's are not allowed. Change of the Engine ID will clear all original	
	local users.	

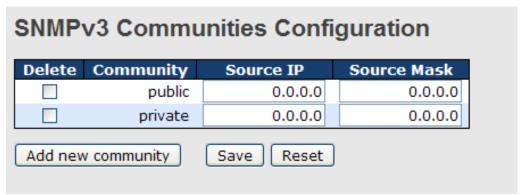

Label	Description	
	Indicates existing SNMP trap mode. Possible modes include:	
Trap Mode	Enabled: enable SNMP trap mode	
	Disabled: disable SNMP trap mode	
	Indicates the supported SNMP trap version. Possible versions	
	include:	
Trap Version	SNMP v1: supports SNMP trap version 1	
	SNMP v2c: supports SNMP trap version 2c	
	SNMP v3: supports SNMP trap version 3	
	Indicates the community access string when sending SNMP trap	
Trap Community	packets. The allowed string length is 0 to 255, and only ASCII	
	characters from 33 to 126 are allowed.	
Trap Destination	Indicates the SNMP trap destination address	
Address		
	Provides the trap destination IPv6 address of this switch. IPv6	
	address consists of 128 bits represented as eight groups of four	
Trap Destination	hexadecimal digits with a colon separating each field (:). For	
IPv6 Address	example, in 'fe80::215:c5ff:fe03:4dc7', the symbol '::' is a special	
II VO Address	syntax that can be used as a shorthand way of representing multiple	
	16-bit groups of contiguous zeros; but it can only appear once. It also	
	uses a following legally IPv4 address. For example, '::192.1.2.34'.	
Trap	Indicates the SNMP entity is permitted to generate authentication	
Authentication	failure traps. Possible modes include:	
Failure	Enabled: enable SNMP trap authentication failure	

	Disabled: disable SNMP trap authentication failure
	Indicates the SNMP trap link-up and link-down mode. Possible
Trap Link-up and	modes include:
Link-down	Enabled: enable SNMP trap link-up and link-down mode
	Disabled: disable SNMP trap link-up and link-down mode
	Indicates the SNMP trap inform mode. Possible modes include:
Trap Inform Mode	Enabled: enable SNMP trap inform mode
	Disabled: disable SNMP trap inform mode
Trap Inform	Configures the SNMP trap inform timeout. The allowed range is 0 to
Timeout(seconds)	2147.
Trap Inform Retry	Configures the retry times for SNMP trap inform. The allowed range
Times	is 0 to 255.

## **5.5.2 SNMP Community Configurations**

You can define access to the SNMP data on your devices by creating one or more SNMP communities. An SNMP community is the group that devices and management stations running SNMP belong to. It helps define where information is sent. A SNMP device or agent may belong to more than one SNMP community. It will not respond to requests from management stations that do not belong to one of its communities. This page allows you to configure SNMPv3 community table. The entry index key is **Community**.

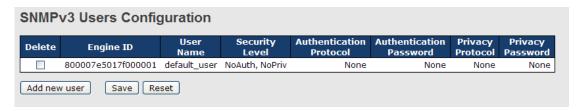

Label	Description	
Delete	Check to delete the entry. It will be deleted during the next save.	
	Indicates the community access string to permit access to SNMPv3	
Community	agent. The allowed string length is 1 to 32, and only ASCII characters	
	from 33 to 126 are allowed.	
Source IP	Indicates the SNMP source address	
Source Mask	Indicates the SNMP source address mask	

## **5.5.3 SNMP User Configurations**

Each SNMP user has a specified username, a group to which the user belongs, authentication password, authentication protocol, privacy protocol, and privacy password. When you create a user, you must associate it with an SNMP group. The user then inherits the security model of the group. This page allows you to configure the SNMPv3 user table. The entry index keys are **Engine ID** and **User Name**.

Label	Description	
Delete	Check to delete the entry. It will be deleted during the next save.	
	An octet string identifying the engine ID that this entry should belong	
	to. The string must contain an even number between 10 and 64	
	hexadecimal digits, but all-zeros and all-'F's are not allowed. The	
	SNMPv3 architecture uses User-based Security Model (USM) for	
	message security and View-based Access Control Model (VACM) for	
Engine ID	access control. For the USM entry, the usmUserEngineID and	
Engine ID	usmUserName are the entry keys. In a simple agent,	
	usmUserEngineID is always that agent's own snmpEngineID value.	
	The value can also take the value of the snmpEngineID of a remote	
	SNMP engine with which this user can communicate. In other words,	
	if user engine ID is the same as system engine ID, then it is local	
	user; otherwise it's remote user.	
	A string identifying the user name that this entry should belong to.	
User Name	The allowed string length is 1 to 32, and only ASCII characters from	
	33 to 126 are allowed.	
	Indicates the security model that this entry should belong to. Possible	
	security models include:	
	NoAuth, NoPriv: no authentication and none privacy	
Security Level	Auth, NoPriv: Authentication and no privacy	
	Auth, Priv: Authentication and privacy	
	The value of security level cannot be modified if the entry already	
	exists, which means the value must be set correctly at the time of	
	entry creation.	
	1	

	Indicates the authentication protocol that this entry should belong to.		
	Possible authentication protocols include:		
	None: no authentication protocol		
	MD5: an optional flag to indicate that this user is using MD5		
Authentication	authentication protocol		
Protocol	SHA: an optional flag to indicate that this user is using SHA		
	authentication protocol		
	The value of security level cannot be modified if the entry already		
	exists, which means the value must be set correctly at the time of		
	entry creation.		
	A string identifying the authentication pass phrase. For MD5		
Authentication	authentication protocol, the allowed string length is 8 to 32. For SHA		
Password	authentication protocol, the allowed string length is 8 to 40. Only		
	ASCII characters from 33 to 126 are allowed.		
	Indicates the privacy protocol that this entry should belong to.		
	Possible privacy protocols include:		
Privacy Protocol	None: no privacy protocol		
	DES: an optional flag to indicate that this user is using DES		
	authentication protocol		
Driveey Decemend	A string identifying the privacy pass phrase. The allowed string length		
Privacy Password	is 8 to 32, and only ASCII characters from 33 to 126 are allowed.		

#### **5.5.4 SNMP Group Configurations**

An SNMP group is an access control policy for you to add users. Each SNMP group is configured with a security model, and is associated with an SNMP view. A user within an SNMP group should match the security model of the SNMP group. These parameters specify what type of authentication and privacy a user within an SNMP group uses. Each SNMP group name and security model pair must be unique. This page allows you to configure the SNMPv3 group table. The entry index keys are **Security Model** and **Security Name**.

Delete	Security Model	Security Name	Group Name
	v1	public	default_ro_group
	v1	private	default_rw_group
	v2c	public	default_ro_group
	v2c	private	default_rw_group
	usm	default_user	default_rw_group

Label	Description	
Delete	Check to delete the entry. It will be deleted during the next save.	
	Indicates the security model that this entry should belong to. Possible	
	security models included:	
Security Model	v1: Reserved for SNMPv1.	
	v2c: Reserved for SNMPv2c.	
	usm: User-based Security Model (USM).	
	A string identifying the security name that this entry should belong to.	
Security Name	The allowed string length is 1 to 32, and only ASCII characters from	
	33 to 126 are allowed.	
	A string identifying the group name that this entry should belong to.	
Group Name	The allowed string length is 1 to 32, and only ASCII characters from	
	33 to 126 are allowed.	

## 5.5.5 SNMP View Configurations

The SNMP v3 View table specifies the MIB object access requirements for each View Name. You can specify specific areas of the MIB that can be accessed or denied based on the entries or create and delete entries in the View table in this page. The entry index keys are **View Name** and **OID Subtree**.

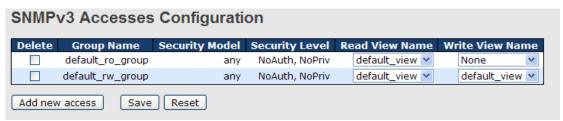

Label	Description
Delete	Check to delete the entry. It will be deleted during the next save.
	A string identifying the view name that this entry should belong to.
View Name	The allowed string length is 1 to 32, and only ASCII characters from
	33 to 126 are allowed.
	Indicates the view type that this entry should belong to. Possible view
	types include:
	Included: an optional flag to indicate that this view subtree should be
	included.
View Type	Excluded: An optional flag to indicate that this view subtree should
	be excluded.
	Generally, if an entry's view type is <b>Excluded</b> , it should exist another
	entry whose view type is <b>Included</b> , and its OID subtree oversteps
	the <b>Excluded</b> entry.
	The OID defining the root of the subtree to add to the named view.
OID Subtree	The allowed OID length is 1 to 128. The allowed string content is
	digital number or asterisk (*).

# **5.5.6 SNMP Access Configurations**

This page allows you to configure SNMPv3 access table. The entry index keys are **Group Name**, **Security Model**, and **Security Level**.

Label	Description	
Delete	Check to delete the entry. It will be deleted during the next save.	
	A string identifying the group name that this entry should belong to.	
<b>Group Name</b>	The allowed string length is 1 to 32, and only ASCII characters from	
	33 to 126 are allowed.	
	Indicates the security model that this entry should belong to. Possible	
	security models include:	
Security Model	any: Accepted any security model (v1 v2c usm).	
	v1: Reserved for SNMPv1.	
	v2c: Reserved for SNMPv2c.	

	usm: User-based Security Model (USM).
	Indicates the security model that this entry should belong to. Possible
	security models include:
Security Level	NoAuth, NoPriv: no authentication and no privacy
	Auth, NoPriv: Authentication and no privacy
	Auth, Priv: Authentication and privacy
	The name of the MIB view defining the MIB objects for which this
Read View Name	request may request the current values. The allowed string length is
	1 to 32, and only ASCII characters from 33 to 126 are allowed.
	The name of the MIB view defining the MIB objects for which this
Write View Name	request may potentially SET new values. The allowed string length is
	1 to 32, and only ASCII characters from 33 to 126 are allowed.

## 5.6 Traffic Prioritization

#### 5.6.1 Storm Control

A LAN storm occurs when packets flood the LAN, creating excessive traffic and degrading network performance. Errors in the protocol-stack implementation, mistakes in network configuration, or users issuing a denial-of-service attack can cause a storm. Storm control prevents traffic on a LAN from being disrupted by a broadcast, multicast, or unicast storm on a port. In this page, you can specify the rate at which packets are received for unicast, multicast, and broadcast traffic. The unit of the rate can be either pps (packets per second) or kpps (kilopackets per second).

Note: frames sent to the CPU of the switch are always limited to approximately 4 kpps. For example, broadcasts in the management VLAN are limited to this rate. The management VLAN is configured on the IP setup page.

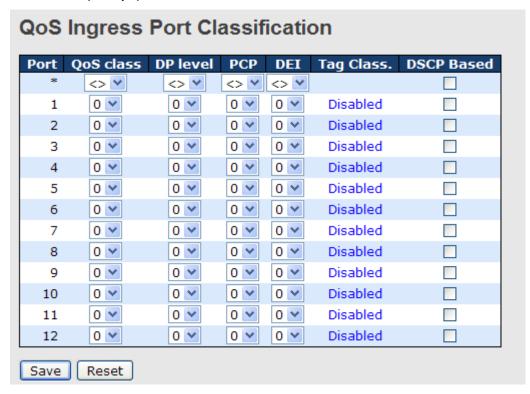

Label	Description
Frame Type	Frame types supported by the Storm Control function, including

	Unicast, Multicast, and Broadcast.	
Status	Enables or disables the given frame type	
	The rate is packet per second (pps), configure the rate as 1K, 2K,	
Rate	4K, 8K, 16K, 32K, 64K, 128K, 256K, 512K, or 1024K.	
	The 1 kpps is actually 1002.1 pps.	

#### 5.6.2 Port Classification

QoS (Quality of Service) is a method to achieve efficient bandwidth utilization between devices by prioritizing frames according to individual requirements and transmit the frames based on their importance. Frames in higher priority queues receive a bigger slice of bandwidth than those in a lower priority queue.

Label	Description	
Port	The port number for which the configuration below applies	
	Controls the default QoS class	
	All frames are classified to a QoS class. There is a one to one	
	mapping between QoS class, queue, and priority. A QoS class of	
QoS Class	0 (zero) has the lowest priority.	
	If the port is VLAN aware and the frame is tagged, then the frame	
	is classified to a QoS class that is based on the PCP value in the	
	tag as shown below. Otherwise the frame is classified to the	

	default QoS class.
	PCP value: 0 1 2 3 4 5 6 7
	QoS class: 1 0 2 3 4 5 6 7
	If the port is VLAN aware, the frame is tagged, and Tag Class is
	enabled, then the frame is classified to a QoS class that is
	mapped from the PCP and DEI value in the tag. Otherwise the
	frame is classified to the default QoS class.
	The classified QoS class can be overruled by a QCL entry.
	Note: if the default QoS class has been dynamically changed,
	then the actual default QoS class is shown in parentheses after
	the configured default QoS class.
	Controls the default Drop Precedence Level
	All frames are classified to a DP level.
	If the port is VLAN aware and the frame is tagged, then the frame
	is classified to a DP level that is equal to the DEI value in the tag.
	Otherwise the frame is classified to the default DP level.
DP level	If the port is VLAN aware, the frame is tagged, and Tag Class is
	enabled, then the frame is classified to a DP level that is mapped
	from the PCP and DEI value in the tag. Otherwise the frame is
	classified to the default DP level.
	The classified DP level can be overruled by a QCL entry.
	Controls the default PCP value
	All frames are classified to a PCP value.
PCP	If the port is VLAN aware and the frame is tagged, then the frame
	is classified to the PCP value in the tag. Otherwise the frame is
	classified to the default PCP value.
	Controls the default DEI value
	All frames are classified to a DEI value.
DEI	If the port is VLAN aware and the frame is tagged, then the frame
	is classified to the DEI value in the tag. Otherwise the frame is
	classified to the default DEI value.
	Shows the classification mode for tagged frames on this port
	<b>Disabled</b> : Use default QoS class and DP level for tagged frames
	Enabled: Use mapped versions of PCP and DEI for tagged
Tag Class	frames
	Click on the mode to configure the mode and/or mapping
	Note: this setting has no effect if the port is VLAN unaware.
	Troto. this setting has no effect if the port is VEAN unlawate.

	Tagged frames received on VLAN-unaware ports are always	
	classified to the default QoS class and DP level.	
DSCP Based	Click to enable DSCP-based QoS Ingress Port Classification	

## 5.6.3 Port Tag Remaking

You can set QoS egress queues on a port such as classifying data and marking it according to its priority and the policies. Packets will then travel across the switch's internal paths carrying their assigned QoS tag markers. At the egress port, these markers are read and used to determine which queue each data packet is forwarded to. When the traffic does not conform to the conditions set in a policer command, you can remark the traffic.

oS	Egress
Port	Mode
1	Classified
2	Classified
	Classified
4	Classified
	Classified
6	Classified
7	Classified
8	Classified
9	Classified
10	Classified
11	Classified
12	Classified

Label	Description	
Dort	The switch port number to which the following settings will be	
Port	applied. Click on the port number to configure tag remarking	
	Shows the tag remarking mode for this port	
Mode	Classified: use classified PCP/DEI values	
Wode	Default: use default PCP/DEI values	
	Mapped: use mapped versions of QoS class and DP level	

#### 5.6.4 Port DSCP

DSCP (Differentiated Services Code Point) is a measure of QoS. It can classify data packets by using the 6-bit DS field in the IP header so you can manage each traffic class differently and efficiently, thereby achieving optimized use of network bandwidth. DSCP-enabled routers on the network will read the DSCP value of the data packet and put the packet into different queues before transmission, such as high priority and most efficient transmission. With such QoS functions, you can ensure low-latency for critical traffic. This page allows you to configure

DSCP settings for each port.

#### **QoS Port DSCP Configuration Ingress Egress** Port Classify Translate Rewrite <> <> Disable Disable 1 2 Disable Disable Disable Disable 3 ٧ 4 Disable Disable 5 Disable Disable 6 Disable Disable \* Disable 7 Disable ٧ 8 Disable Disable 9 Disable Disable ٧ 10 Disable Disable 11 Disable Disable 12 Disable Disable Reset Save

Label	Description
Port	Shows the list of ports for which you can configure DSCP Ingress
Port	and Egress settings.
	In Ingress settings you can change ingress translation and
	classification settings for individual ports.
	There are two configuration parameters available in Ingress:
	Translate: check to enable the function
	Classify: includes four values
Ingress	Disable: no Ingress DSCP classification
	<b>DSCP=0</b> : classify if incoming (or translated if enabled) DSCP is 0.
	Selected: classify only selected DSCP whose classification is
	enabled as specified in <b>DSCP Translation</b> window for the specific
	DSCP.
	All: classify all DSCP
	Port egress rewriting can be one of the following options:
Egress	Disable: no Egress rewrite
Lyicas	Enable: rewrite enabled without remapping
	Remap DP Unaware: DSCP from the analyzer is remapped and

the frame is remarked with a remapped DSCP value. The remapped DSCP value is always taken from the 'DSCP Translation->Egress Remap DP0' table.

Remap DP Aware: DSCP from the analyzer is remapped and the frame is remarked with a remapped DSCP value. Depending on the DP level of the frame, the remapped DSCP value is either taken from the 'DSCP Translation->Egress Remap DP0' table or from the 'DSCP Translation->Egress Remap DP1' table.

## 5.6.5 Policing

Policing is a traffic regulation mechanism for limiting the rate of traffic streams, thereby controlling the maximum rate of traffic sent or received on an interface. When the traffic rate exceeds the configured maximum rate, policing drops or remarks the excess traffic. This page allows you to configure Policer for all switch ports.

## **Port Policing**

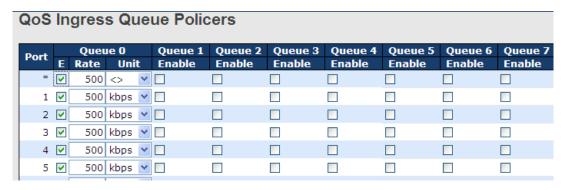

Label	Description
Port	The port number for which the configuration below applies
Enable	Check to enable the policer for individual switch ports
Rate	Configures the rate of each policer. The default value is <b>500</b> . This

	value is restricted to 100 to 1000000 when the Unit is kbps or
	fps, and is restricted to 1 to 3300 when the Unit is Mbps or kfps.
11-4:	Configures the unit of measurement for each policer rate as <b>kbps</b> ,
Unti	Mbps, fps, or kfps. The default value is kbps.
Flow Control	If Flow Control is enabled and the port is in Flow Control mode,
	then pause frames are sent instead of being discarded.

## **Queue Policing**

Label	Description			
Port	The port number for which the configuration below applies.			
Enable(E)	Check to enable queue policer for individual switch ports			
	Configures the rate of each queue policer. The default value is 500. This			
Rate	value is restricted to 100 to 1000000 when the Unit is kbps, and is			
	restricted to 1 to 3300 when the <b>Unit</b> is <b>Mbps</b> .			
	This field is only shown if at least one of the queue policers is enabled.			
	Configures the unit of measurement for each queue policer rate as kbps			
Unit	or Mbps. The default value is <b>kbps</b> .			
	This field is only shown if at least one of the queue policers is enabled.			

## 5.6.7 Scheduling and Shaping

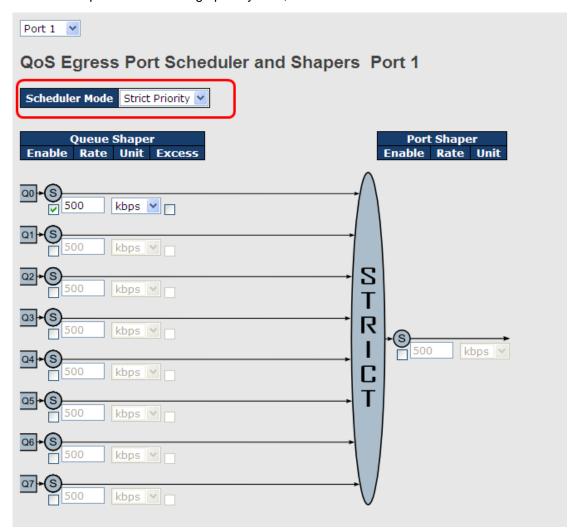

Port scheduling can solve performance degradation during network congestions. The schedulers allow switches to maintain separate queues for packets from each source and prevent specific traffic to use up all bandwidth. This page allows you to configure Scheduler and Shapers for individual ports.

## **QoS Egress Port Scheduler and Shaper Strict Priority**

Strict Priority uses queues based only priority. When traffic arrives the device, traffic on the

highest priority queue will be transmitted first, followed by traffic on lower priorities. If there is always some content in the highest priority queue, then the other packets in the rest of queues will not be sent until the highest priority queue is empty. The SP algorithm is preferred when the received packets contain high priority data, such as voice and video.

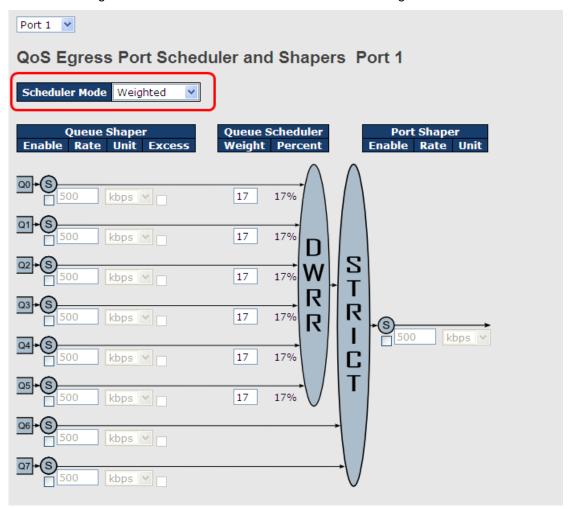

Label	Description
Scheduler Mode	Two scheduling modes are available: Strict Priority or Weighted
Queue Shaper Enable	Check to enable queue shaper for individual switch ports
Queue Shaper Rate	Configures the rate of each queue shaper. The default value is <b>500</b> . This value is restricted to 100 to 1000000 whn the <b>Unit</b> is <b>kbps</b> ", and it is restricted to 1 to 3300 when the <b>Unit</b> is <b>Mbps</b> .
Queues Shaper Unit	Configures the rate for each queue shaper. The default value is <b>500</b> . This value is restricted to 100 to 1000000 when the <b>Unit</b> is <b>kbps</b> , and it is restricted to 1 to 3300 when the <b>Unit</b> is <b>Mbps</b> .

Queue Shaper	Allowe the group to use group benefit into		
Excess	Allows the queue to use excess bandwidth		
Port Shaper Enable	Check to enable port shaper for individual switch ports		
	Configures the rate of each port shaper. The default value is 500		
Port Shaper Rate	This value is restricted to 100 to 1000000 when the <b>Unit</b> is <b>kbps</b> ,		
	and it is restricted to 1 to 3300 when the <b>Unit</b> is <b>Mbps</b> .		
Port Shaper Unit	Configures the unit of measurement for each port shaper rate as		
Port Shaper Unit	kbps or Mbps. The default value is kbps.		

#### Weighted

Weighted scheduling will deliver traffic on a rotating basis. It can guarantee each queue's minimum bandwidth based on their bandwidth weight when there is traffic congestion. Only when a port has more traffic than it can handle will this mode be activated. A queue is given an amount of bandwidth regardless of the incoming traffic on that port. Queue with larger weights will have more guaranteed bandwidth than others with smaller weights.

Label	Description
Scheduler Mode	Two scheduling modes are available: Strict Priority or Weighted
Queue Shaper Enable	Check to enable queue shaper for individual switch ports
Queue Shaper Rate	Configures the rate of each queue shaper. The default value is <b>500</b> . This value is restricted to 100 to 1000000 when the <b>Unit</b> is <b>kbps</b> , and it is restricted to 1 to 3300 when the <b>Unit</b> is <b>Mbps</b> .
Queues Shaper Unit	Configures the rate of each queue shaper. The default value is <b>500</b> . This value is restricted to 100 to 1000000 when the <b>Unit</b> " is <b>kbps</b> , and it is restricted to 1 to 3300 when the <b>Unit</b> is <b>Mbps</b> .
Queue Shaper Excess	Allows the queue to use excess bandwidth
Queue Scheduler Weight	Configures the weight of each queue. The default value is 17. This value is restricted to 1 to 100. This parameter is only shown if Scheduler Mode is set to Weighted.
Queue Scheduler Percent	Shows the weight of the queue in percentage. This parameter is only shown if <b>Scheduler Mode</b> is set to <b>Weighted</b> .
Port Shaper Enable	Check to enable port shaper for individual switch ports
Port Shaper Rate	Configures the rate of each port shaper. The default value is <b>500</b> .  This value is restricted to 100 to 1000000 when the <b>Unit</b> is <b>kbps</b> , and it is restricted to 1 to 3300 when the <b>Unit</b> is <b>Mbps</b> .
Port Shaper Unit	Configures the unit of measurement for each port shaper rate as <b>kbps</b> or <b>Mbps</b> . The default value is <b>kbps</b> .

## 5.6.8 Port Scheduler

This page provides an overview of QoS Egress Port Schedulers for all switch ports.

QoS Egress Port Schedulers							
Dort	Mode			We	ight		
Port	Mode	Q0	Q1	Q2	Q3	Q4	Q5
1	Strict Priority	-	-	-	-	-	-
2	Strict Priority	-	-	-	-	-	-
3	Strict Priority	-	-	-	-	-	-
4	Strict Priority	-	-	-	-	-	-
5	Strict Priority	-	-	-	-	-	-
6	Strict Priority	-	-	-	-	-	-

Label	Description
Port	The switch port number to which the following settings will be

	applied.
	Click on the port number to configure the schedulers
Mode	Shows the scheduling mode for this port
Qn	Shows the weight for this queue and port

#### 5.6.9 Port Shaping

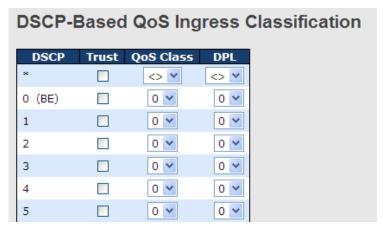

Port shaping enables you to limit traffic on a port, thereby controlling the amount of traffic passing through the port. With port shaping, you can shape the aggregate traffic through an interface to a rate that is less than the line rate for that interface. When configuring port shaping on an interface, you specify a value indicating the maximum amount of traffic allowable for the interface. This value must be less than the maximum bandwidth for that interface.

Label	Description
Port	The switch port number to which the following settings will be applied. Click on the port number to configure the shapers
Mode	Shows disabled or actual queue shaper rate - e.g. "800 Mbps"
Q0~Q7	Shows disabled or actual port shaper rate - e.g. "800 Mbps"

#### 5.6.10 DSCP-based QoS

This page allows you to configure DSCP-based QoS Ingress Classification settings for all ports.

Label	Description				
DSCP	Maximum number of supported DSCP values is 64				
	Check to trust a specific DSCP value. Only frames with trusted				
Truck	DSCP values are mapped to a specific QoS class and drop				
Trust	precedence level. Frames with untrusted DSCP values are				
	treated as a non-IP frame.				
QoS Class	QoS class value can be any number from 0-7.				
DPL	Drop Precedence Level (0-1)				

# 5.6.11 DSCP Translation

This page allows you to configure basic QoS DSCP translation settings for all switches. DSCP translation can apply to **Ingress** or **Egress**.

DSCP		igre		Egress			
DOCF	Transla	te	Classify	Remap D	PO	Remap I	DP1
*	$\Diamond$	~		$\Diamond$	~	$\Leftrightarrow$	~
0 (BE)	0 (BE)	~		0 (BE)	~	0 (BE)	~
1	1	~		1	~	1	~
2	2	~		2	~	2	~
3	3	~		3	~	3	~
4	4	~		4	~	4	~
5	5	~		5	~	5	~
6	6	~		6	~	6	~
7	7	~		7	~	7	~
8 (CS1)	8 (CS1)	~		8 (CS1)	~	8 (CS1)	~
9	9	~		9	~	9	v

Label	Description
Decd	Maximum number of supported DSCP values is 64 and valid
DSCP	DSCP value ranges from 0 to 63.
	Ingress DSCP can be first translated to new DSCP before using
	the DSCP for QoS class and DPL map.
Ingress	There are two configuration parameters for DSCP Translation -
Ingress	Translate: Enables ingress translation of DSCP values based
	on the specified classification method. DSCP can be translated to
	any of (0-63) DSCP values.

	2. Classify: Enable Classification at ingress side as defined in the
	QoS Port DSCP Configuration table.
	Configurable engress parameters include;
	Remap DP0: Re-maps DP0 field to selected DSCP value. DP0
	indicates a drop precedence with a low priority. You can select the
	DSCP value from a selected menu to which you want to remap.
Egress	DSCP value ranges from 0 to 63.
	Remap DP1: Re-maps DP1 field to selected DSCP value. DP1
	indicates a drop precedence with a high priority. You can select
	the DSCP value from a selected menu to which you want to
	remap. DSCP value ranges from 0 to 63.

#### 5.6.12 DSCP Classification

This page allows you to configure the mapping of QoS class and Drop Precedence Level to DSCP value.

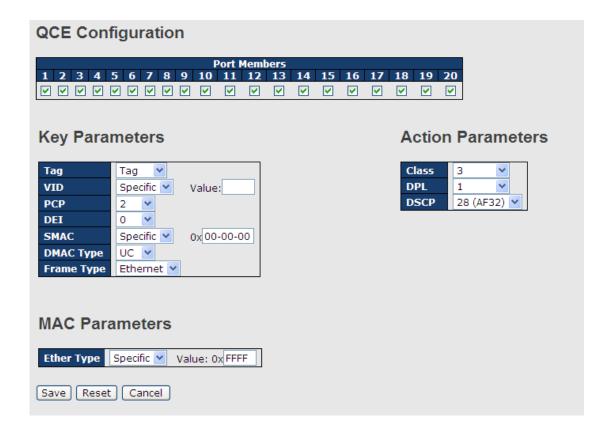

DSCP Classification			
QoS Class	DPL	DSCP	
*	*	$\Diamond$	~
0	0	0 (BE)	~
0	1	8 (CS1)	~
1	0	14 (AF13)	~
1	1	0 (BE)	~
2	0	0 (BE)	~

Label	Description
QoS Class	Actual QoS class
DPL	Actual Drop Precedence Level
DSCP	Select the classified DSCP value (0-63)

## 5.6.13 QoS Control List

This page shows all the QCE (Quality Control Entries) for a given QCL. You can edit or ad new QoS control entries in this page. A QCE consists of several parameters. These parameters vary with the frame type you select.

Label	Description
Port Members	Check to include the port in the QCL entry. By default, all ports are
	included.
Key Parameters	Key configurations include:
	Tag: value of tag, can be Any, Untag or Tag.
	VID: valid value of VLAN ID from 1 to 4095
	Any: can be a specific value or a range of VIDs.
	<b>PCP</b> : Priority Code Point, can be specific numbers (0, 1, 2, 3, 4, 5,
	6, 7), a range (0-1, 2-3, 4-5, 6-7, 0-3, 4-7) or <b>Any</b>
	<b>DEI</b> : Drop Eligible Indicator, can be any of values between 0 and
	1 or <b>Any</b>
	SMAC: Source MAC Address, can be 24 MS bits (OUI) or Any
	DMAC Type: Destination MAC type, can be unicast (UC),
	multicast (MC), broadcast (BC) or Any
	Frame Type can be the following values: Any, Ethernet, LLC,
	SNAP, IPv4, and IPv6
	Note: all frame types are explained below.
Any	Allow all types of frames
Ethernet	Valid Ethernet values can range from 0x600 to 0xFFFF or Any' but

	excluding 0x800(IPv4) and 0x86DD(IPv6). The default value is
	Any.
LLC	SSAP Address: valid SSAP (Source Service Access Point) values
	can range from 0x00 to 0xFF or <b>Any</b> . The default value is <b>Any</b> .
	DSAP Address: valid DSAP (Destination Service Access Point)
	values can range from 0x00 to 0xFF or <b>Any</b> . The default value is
	Any.
	Control Valid Control: valid values can range from 0x00 to 0xFF or
	Any. The default value is Any.
SNAP	PID: valid PID (a.k.a ethernet type) values can range from 0x00 to
	0xFFFF or Any. The default value is Any.
IPv4	Protocol IP Protocol Number: (0-255, TCP or UDP) or Any
	Source IP: specific Source IP address in value/mask format or
	<b>Any</b> . IP and mask are in the format of x.y.z.w where x, y, z, and w
	are decimal numbers between 0 and 255. When the mask is
	converted to a 32-bit binary string and read from left to right, all
	bits following the first zero must also be zero.
	DSCP (Differentiated Code Point): can be a specific value, a
	range, or <b>Any</b> . DSCP values are in the range 0-63 including BE,
	CS1-CS7, EF or AF11-AF43.
	IP Fragment: Ipv4 frame fragmented options include 'yes', 'no',
	and 'any'.
	Sport Source TCP/UDP Port: (0-65535) or <b>Any</b> , specific value or
	port range applicable for IP protocol UDP/TCP
	Dport Destination TCP/UDP Port: (0-65535) or <b>Any</b> , specific
	value or port range applicable for IP protocol UDP/TCP
IPv6	Protocol IP protocol number: (0-255, TCP or UDP) or Any
	Source IP IPv6 source address: (a.b.c.d) or <b>Any</b> , 32 LS bits
	DSCP (Differentiated Code Point): can be a specific value, a
	range, or <b>Any</b> . DSCP values are in the range 0-63 including BE,
	CS1-CS7, EF or AF11-AF43.
	Sport Source TCP/UDP port: (0-65535) or <b>Any</b> , specific value or
	port range applicable for IP protocol UDP/TCP
	Dport Destination TCP/UDP port: (0-65535) or <b>Any</b> , specific value
	or port range applicable for IP protocol UDP/TCP
Action Parameters	Class QoS class: (0-7) or <b>Default</b>
Action i arameters	Valid Drop Precedence Level value can be (0-1) or <b>Default</b> .
	valid Drop i recodence Level value can be (0-1) of Delault.

Valid DSCP value can be (0-63, BE, CS1-CS7, EF or AF11-AF43)
or <b>Default</b> .
Default means that the default classified value is not modified by
this QCE.

#### 5.6.14 QoS Counters

This page shows information on the number of packets sent and received at each queue.

Label	Description
Port	The switch port number to which the following settings will be applied.
Qn	There are 8 QoS queues per port. Q0 is the lowest priority
Rx / Tx	The number of received and transmitted packets per queue

#### **5.6.15 QCL Status**

This page shows the QCL status by different QCL users. Each row describes the QCE that is defined. A conflict will occur if a specific QCE is not applied to the hardware due to hardware limitations. The maximum number of QCEs is 256 on each switch.

Label	Description
User	Indicates the QCL user
QCE#	Indicates the index of QCE
	Indicates the type of frame to look for incoming frames. Possible
	frame types are:
	Any: the QCE will match all frame type.
	Ethernet: Only Ethernet frames (with Ether Type 0x600-0xFFFF)
Frame Type	are allowed.
	LLC: Only (LLC) frames are allowed.
	SNAP: Only (SNAP) frames are allowed.
	IPv4: the QCE will match only IPV4 frames.
	IPv6: the QCE will match only IPV6 frames.
Port	Indicates the list of ports configured with the QCE.
	Indicates the classification action taken on ingress frame if
	parameters configured are matched with the frame's content.
	There are three action fields: Class, DPL, and DSCP.
	Class: Classified QoS; if a frame matches the QCE, it will be put
Action	in the queue.
	<b>DPL</b> : Drop Precedence Level; if a frame matches the QCE, then
	DP level will set to a value displayed under DPL column.
	<b>DSCP</b> : if a frame matches the QCE, then DSCP will be classified
	with the value displayed under DSCP column.
	Displays the conflict status of QCL entries. As hardware
Conflict	resources are shared by multiple applications, resources required
	to add a QCE may not be available. In that case, it shows conflict
	status as Yes, otherwise it is always No. Please note that conflict
	can be resolved by releasing the hardware resources required to
	add the QCL entry by pressing Resolve Conflict button.

# 5.7 Multicast

# 5.7.1 IGMP Snooping

IGMP (Internet Group Management Protocol) snooping monitors the IGMP traffic between hosts and multicast routers. The switch uses what IGMP snooping learns to forward multicast traffic only to interfaces that are connected to interested receivers. This conserves bandwidth by allowing the switch to send multicast traffic to only those interfaces that are connected to hosts that want to receive the traffic, instead of flooding the traffic to all interfaces in the VLAN.

This page allows you to set up IGMP snooping configurations.

IGMP Snooping Configuration			
	Global Con	figuration	
Snooping	Enabled	_	
Unregiste	ered IPMCv4 F	Flooding Enable	d 🗹
Port Related Configuration			
*			
1			
2			
3			
4			
5			
6			

Label	Description
Snooping Enabled	Check to enable global IGMP snooping
Unregistered	
IPMCv4Flooding	Check to enable unregistered IPMC traffic flooding
enabled	
	Specifies which ports act as router ports. A router port is a port on the
	Ethernet switch that leads towards the Layer 3 multicast device or
Router Port	IGMP querier.
	If an aggregation member port is selected as a router port, the whole
	aggregation will act as a router port.
Fast Leave	Check to enable fast leave on the port

## 5.7.2 VLAN Configurations of IGMP Snooping

If a VLAN is not IGMP snooping-enabled, it floods multicast data and control packets to the entire VLAN in hardware. When snooping is enabled, IGMP packets are trapped to the CPU. Data packets are mirrored to the CPU in addition to being VLAN flooded. The CPU then installs hardware resources, so that subsequent data packets can be switched to desired ports in hardware without going to the CPU.

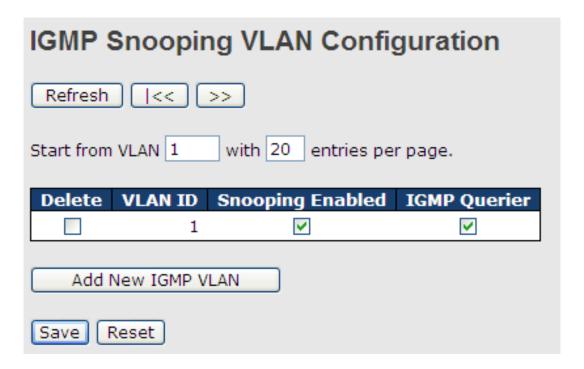

Each page shows up to 99 entries from the VLAN table, depending on the value in the **Entries Per Page** field. By default, the page will show the first 20 entries from the beginning of the

VLAN table. The first displayed will be the one with the lowest VLAN ID found in the VLAN Table.

The **VLAN** field allows the user to select the starting point in the VLAN Table. Clicking **Refresh** will update the displayed table starting from that or the next closest VLAN Table match.

The >> button will use the last entry of the currently displayed entry as a basis for the next lookup. When the end is reached, the text **No more entries** is shown in the displayed table. Use the |<< button to start over.

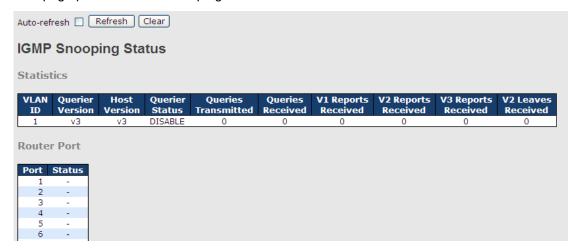

Label	Description
Delete	Check to delete the entry. The designated entry will be deleted during
	the next save.
VLAN ID	The VLAN ID of the entry
IGMP Snooping	Check to enable IGMP snooping for individual VLAN. Up to 32
Enable	VLANs can be selected.
IGMP Querier	Check to enable the IGMP Querier in the VLAN

## 5.7.3 IGMP Snooping Status

This page provides IGMP snooping status.

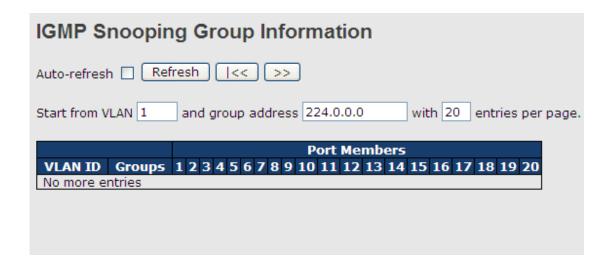

Label	Description	
VLAN ID	The VLAN ID of the entry	
Querier Version	Active Querier version	
<b>Host Version</b>	Active Host version	
Querier Status	Shows the Querier status as <b>ACTIVE</b> or <b>IDLE</b>	
Querier Receive	The number of transmitted Querier	
V1 Reports	The number of received V1 reports	
Receive	The number of received V1 reports	
V2 Reports	The number of received V2 reports	
Receive	The number of received V2 reports	
V3 Reports	The number of received V3 reports	
Receive	The number of received v3 reports	
V2 Leave Receive	The number of received V2 leave packets	
Refresh	Click to refresh the page immediately	
Clear	Clear all statistics counters	
Auto-refresh	Check to enable an automatic refresh of the page at regular intervals	
Port	Switch port number	
Status	Indicates whether a specific port is a router port or not	

## 5.7.4 Groups Information of IGMP Snooping

Information about entries in the **IGMP Group Table** is shown in this page. The **IGMP Group Table** is sorted first by VLAN ID, and then by group.

Label	Description
VLAN ID	The VLAN ID of the group
Groups	The group address of the group displayed
Port Members	Ports under this group

# 5.8 Security

## **5.8.1 Remote Control Security Configurations**

**Remote Control Security** allows you to limit remote access to the management interface. When enabled, requests of the client which is not in the allowed list will be rejected.

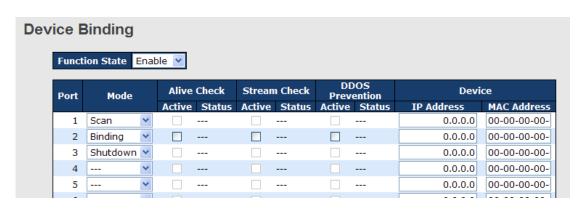

Label	Description	
Port	Port number of the remote client	
IP Address	IP address of the remote client. <b>0.0.0.0</b> means "any IP".	
Web	Check to enable management via a Web interface	

Telnet	Check to enable management via a Telnet interface	
SNMP	Check to enable management via a SNMP interface	
Delete	Check to delete entries	

#### 5.8.2 Device Binding

Device binding is ORing's proprietary technology which binds the IP/MAC address of a device with a specified Ethernet port. If the IP/MAC address of the device connected to the Ethernet port does not conform to the binding requirements, the device will be locked for security concerns. Device Binding also provides security functions via alive checking, streaming check, and DoS/DDoS prevention.

Label	Description			
	Indicates the device binding operation for each port. Possible modes			
	are:			
	: disable			
Mode	Scan: scans IP/MAC automatically, but no binding function			
	Binding: enables binding. Under this mode, any IP/MAC that does			
	not match the entry will not be allowed to access the network.			
	Shutdown: shuts down the port (No Link)			
Alive Check	Check to enable alive check. When enabled, switch will ping the			
Active	device continually.			
	Indicates alive check status. Possible statuses are:			
	: disable			
Alive Check	Got Reply: receive ping reply from device, meaning the device is still			
Status	alive			
	Lost Reply: not receiving ping reply from device, meaning the device			
	might have been dead.			
Stream Check	Check to enable stream check. When enabled, the switch will detect			
Active	the stream change (getting low) from the device.			

	Indicates stream check status. Possible statuses are:		
Stream Check	: disable		
Status	Normal: the stream is normal.		
	Low: the stream is getting low.		
DDoS Prevention	Check to enable DDOS prevention. When enabled, the switch will		
Acton	monitor the device against DDOS attacks.		
	Indicates DDOS prevention status. Possible statuses are:		
DDoS Prevention	: disable		
Status	Analyzing: analyzes packet throughput for initialization		
Status	Running: analysis completes and ready for next move		
	Attacked: DDOS attacks occur		
Device IP Address	Specifies IP address of the device		
Device MAC	Consider MAC address of the device		
Address	Specifies MAC address of the device		

# Advanced Configurations Alias IP Address

This page provides alias IP address configuration. Some devices might have more than one IP addresses. You could specify other IP addresses here.

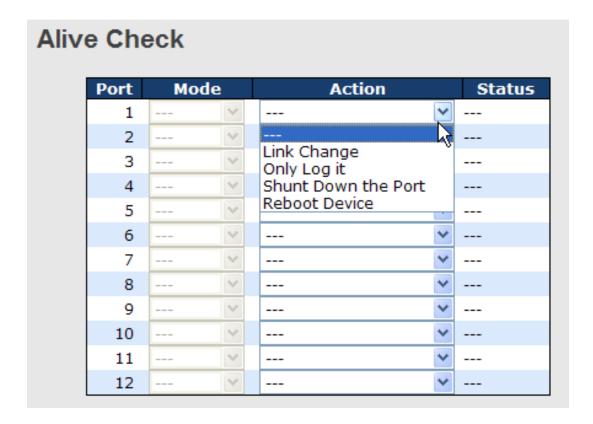

Alias IP Address			
	Port	Alias IP Address	
	1	0.0.0.0	
	2	0.0.0.0	
	3	0.0.0.0	
	4	0.0.0.0	
	5	0.0.0.0	
	6	0.0.0.0	
	7	0.0.0.0	

Label	Description	
Alias IP Address	Specifies alias IP address. Keep 0.0.0.0 if the device does not have	
	an alias IP address.	

#### **Alive Check**

Alive Check monitors the real-time status of the device connected to the port. Alive-checking packets will be sent to the device to probe if the device is running. If the switch receives no response from the device, actions will be taken according to your configurations.

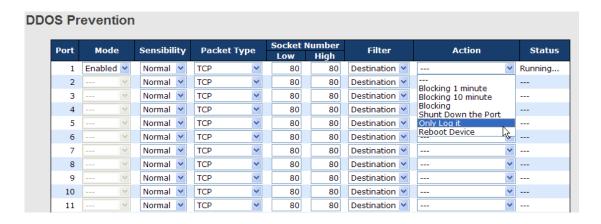

Label	Description	
Link Change	Disables or enables the port	
Only log it	Simply sends logs to the log server	
Shunt Down the	Disables the port	
Port	Disables the port	
Reboot Device	Disables or enables PoE power	

#### **DDoS Prevention**

The switch can monitor ingress packets, and perform actions when DDOS attack occurred on this port. When network traffic from a specific device increases significantly in a short period of time, the switch will lock the IP address of that device to protect the network from attacks. You can configure DDoS prevention on this page to achieve maximum protection.

Label	Description		
Mode	Enables or disables DDOS prevention of the port		
	Indicates the level of DDOS detection. Possible levels are:		
	Low: low sensibility		
Sensibility	Normal: normal sensibility		
	Medium: medium sensibility		
	High: high sensibility		
	Indicates the types of DDoS attack packets to be monitored. Possible		
	types are:		
	RX Total: all ingress packets		
Dookst Type	RX Unicast: unicast ingress packets		
Packet Type	RX Multicast: multicast ingress packets		
	RX Broadcast: broadcast ingress packets		
	TCP: TCP ingress packets		
	UDP: UDP ingress packets		
	If packet type is UDP (or TCP), please specify the socket number		
Socket Number	here. The socket number can be a range, from low to high. If the		
Socket Number	socket number is only one, please fill the same number in the low		
	and high fields.		
Filter	If packet type is UDP (or TCP), please choose the socket direction		
Titter	(Destination/Source).		
	Indicates the action to take when DDOS attacks occur. Possible		
Action	actions are:		
	: no action		
Action	Blocking 1 minute: blocks the forwarding for 1 minute and log the		
	event		
	Blocking 10 minute: blocks the forwarding for 10 minutes and log		

	the event
	Blocking: blocks and logs the event
	Shunt Down the Port: shuts down the port (No Link) and logs the
	event
	Only Log it: simply logs the event
	Reboot Device: if PoE is supported, the device can be rebooted.
	The event will be logged.
	Indicates the DDOS prevention status. Possible statuses are:
	: disables DDOS prevention
Status	Analyzing: analyzes packet throughput for initialization
	Running: analysis completes and ready for next move
	Attacked: DDOS attacks occur

## **Device Description**

This page allows you to configure device description settings.

# **Device Description**

Dort	Device			
Port	Туре		Location Address	Description
1	IP Camera	~		
2	IP Phone	~		
3	Access Point	~		
4	PC	~		
5	PLC	~		
6	Network Video Recorder	~		
7		~

Label	Description	
	Indicates device types. Possible types are:	
	: no specification	
Device Type	IP Camera	
	IP Phone	
	Access Point	

	PC
	PLC
	Network Video Recorder
Location Address	Indicates location information of the device. The information can be
	used for Google Mapping.
Description	Device descriptions

#### Stream Check

Stream check monitors the consistency of real-time network traffic from the device bound with the port. When the traffic changes sharply all of a sudden, an alert will be issued. This page allows you to configure stream check settings.

Label	Description		
Mode	Enables or disables stream monitoring of the port		
Action	Indicates the action to take when the stream gets low. Possible		
	actions are:		
	: no action		
	Log it: simply logs the event		

#### 5.8.3 ACL

An ACL (Access Control List) is a list of permissions attached to an object. An ACL specifies which users or system processes are authorized to access the objects and what operations are allowed on given objects.

#### **Port Configuration**

#### **ACL Ports Configuration** Refresh Clear Policy **Rate Limiter** Port Action **Port Copy** Logging Shutdown Counter ID ID 1 1 💙 Permit 💌 Disabled 💌 Disabled 💌 Disabled 💌 Disabled 🕶 108498 Permit 💌 2 1 💙 Disabled 💌 Disabled V Disabled 💌 Disabled V 3 1 💙 Permit 💌 Disabled 💌 Disabled 💌 Disabled 💌 Disabled 💌 68732984 Permit 💌 4 1 ~ Disabled 💌 Disabled 💌 Disabled 💌 Disabled V 0 Permit 💌 5 1 ~ Disabled 💌 Disabled 💌 Disabled 💌 Disabled 💌 0 Disabled 💌 6 1 ~ Permit 💌 Disabled 💌 Disabled 💌 Disabled 💌 68732984 Permit 💌 7 1 ~ Disabled 💌 Disabled 💌 Disabled 💌 Disabled 💌 0 8 1 💙 Permit 💌 Disabled 💌 Disabled 💌 Disabled 💌 Disabled 💌 0

Label	Description	
Port	The switch port number to which the following settings will be applied	
Policy ID	Select to apply a policy to the port. The allowed values are 1 to 8.	
Policy ID	The default value is 1.	
Action	Select to <b>Permit</b> to permit or <b>Deny</b> to deny forwarding. The default	
Action	value is <b>Permit</b> .	
Rate Limiter ID	Select a rate limiter for the port. The allowed values are <b>Disabled</b> or	
Rate Limiter ID	numbers from 1 to 15. The default value is <b>Disabled</b> .	
Port Conv	Select which port frames are copied to. The allowed values are	
Port Copy	<b>Disabled</b> or a specific port number. The default value is <b>Disabled</b> .	
	Specifies the logging operation of the port. The allowed values are:	
	Enabled: frames received on the port are stored in the system log	
Logging	Disabled: frames received on the port are not logged	
	The default value is <b>Disabled</b> . Please note that system log memory	
	capacity and logging rate is limited.	
	Specifies the shutdown operation of this port. The allowed values	
	are:	
Shutdown	<b>Enabled</b> : if a frame is received on the port, the port will be disabled.	
	Disabled: port shut down is disabled.	
	The default value is <b>Disabled</b> .	
Counter	Counts the number of frames that match this ACE.	

#### **Rate Limiters**

This page allows you to define the rate limits applied to a port.

ACL Rate Limiter Configuration			
Rate Limiter ID	Rate	(pps)	
1	1	~	
2	1	~	
3	1	~	
4	1	~	
5	1	~	
6	1	~	
7	1	~	
8	1	~	
9	1	~	
10	1	~	
11	1	~	
12	1	~	

Label	Description	
Rate Limiter ID	The rate limiter ID for the settings contained in the same row.	
	The rate unit is packet per second (pps), which can be configured as	
Data	1, 2, 4, 8, 16, 32, 64, 128, 256, 512, 1K, 2K, 4K, 8K, 16K, 32K, 64K,	
Rate	128K, 256K, 512K, or 1024K.	
	The 1 kpps is actually 1002.1 pps.	

#### **ACL Control List**

An ACE (Access Control Entry) is an element in an access control list (ACL). An ACL can have zero or more ACEs. Each ACE controls or monitors access to an object based on user-defined configurations. Each ACE consists of several parameters which vary with the frame type you have selected.

Label	Description
Ingress Port	Indicates the ingress port to which the ACE will apply.

	Any: the ACE applies to any port		
	<b>Port n</b> : the ACE applies to this port number, where n is the number		
	of the switch port.		
	<b>Policy n</b> : the ACE applies to this policy number, where n can range		
	from 1 to 8.		
	Indicates the frame type of the ACE. These frame types are		
	mutually exclusive.		
	Any: any frame can match the ACE.		
	Ethernet Type: only Ethernet type frames can match the ACE. The		
F T	IEEE 802.3 descripts the value of length/types should be greater		
Frame Type	than or equal to 1536 decimal (equal to 0600 hexadecimal).		
	ARP: only ARP frames can match the ACE. Notice the ARP frames		
	will not match the ACE with Ethernet type.		
	IPv4: only IPv4 frames can match the ACE. Notice the IPv4 frames		
	will not match the ACE with Ethernet type.		
	Specifies the action to take when a frame matches the ACE.		
Action	Permit: takes action when the frame matches the ACE.		
	Deny: drops the frame matching the ACE.		
	Specifies the rate limiter in number of base units. The allowed		
Rate Limiter	range is 1 to 15. Disabled means the rate limiter operation is		
	disabled.		
	Frames matching the ACE are copied to the port number specified		
Port Copy	here. The allowed range is the same as the switch port number		
	range. Disabled means the port copy operation is disabled.		
	Specifies the logging operation of the ACE. The allowed values are:		
	Enabled: frames matching the ACE are stored in the system log.		
Logging	Disabled: frames matching the ACE are not logged.		
	Please note that system log memory capacity and logging rate is		
	limited.		
	Specifies the shutdown operation of the ACE. The allowed values		
	are:		
Shutdown	Enabled: if a frame matches the ACE, the ingress port will be		
	disabled.		
	Disabled: port shutdown is disabled for the ACE.		
Counter	Indicates the number of times the ACE matched by a frame.		

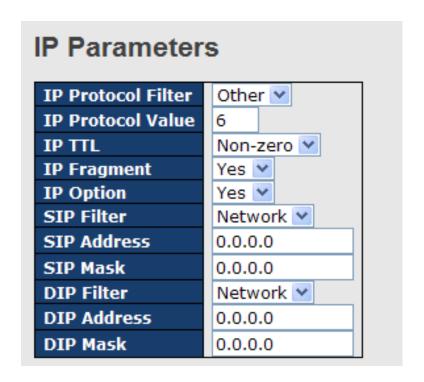

# MAC Parameters SMAC Filter SMAC Value DMAC Filter DMAC Value DMAC Value O0-00-00-00-00-0:

Label	Description		
	(Only displayed when the frame type is Ethernet Type or ARP.)		
	Specifies the source MAC filter for the ACE.		
SMAC Filter	Any: no SMAC filter is specified (SMAC filter status is "don't-care").		
	Specific: if you want to filter a specific source MAC address with the		
	ACE, choose this value. A field for entering an SMAC value appears.		
	When Specific is selected for the SMAC filter, you can enter a		
SMAC Value	specific source MAC address. The legal format is		
SWAC value	"xx-xx-xx-xx-xx". Frames matching the ACE will use this SMAC		
	value.		
	Specifies the destination MAC filter for this ACE		
	Any: no DMAC filter is specified (DMAC filter status is "don't-care").		
	MC: frame must be multicast.		
DMAC Eilter	BC: frame must be broadcast.		
DMAC Filter	UC: frame must be unicast.		
	Specific: If you want to filter a specific destination MAC address with		
	the ACE, choose this value. A field for entering a DMAC value		
	appears.		
	When Specific is selected for the DMAC filter, you can enter a		
DMAC Value	specific destination MAC address. The legal format is		
DIVIAC VAIUE	"xx-xx-xx-xx-xx". Frames matching the ACE will use this DMAC		
	value.		

Label	Description	
	Specifies the VLAN ID filter for the ACE	
	Any: no VLAN ID filter is specified (VLAN ID filter status is	
VLAN ID Filter	"don't-care").	
	Specific: if you want to filter a specific VLAN ID with the ACE,	
	choose this value. A field for entering a VLAN ID number appears.	
	When Specific is selected for the VLAN ID filter, you can enter a	
VLAN ID	specific VLAN ID number. The allowed range is 1 to 4095. Frames	
	matching the ACE will use this VLAN ID value.	
	Specifies the tag priority for the ACE. A frame matching the ACE will	
Tag Priority	use this tag priority. The allowed number range is 0 to 7. <b>Any</b> means	
	that no tag priority is specified (tag priority is "don't-care").	

Label	Description		
	Specifies the IP protocol filter for the ACE		
	Any: no IP protocol filter is specified ("don't-care").		
	<b>Specific</b> : if you want to filter a specific IP protocol filter with the ACE,		
	choose this value. A field for entering an IP protocol filter appears.		
	ICMP: selects ICMP to filter IPv4 ICMP protocol frames. Extra fields		
	for defining ICMP parameters will appear. For more details of these		
IP Protocol Filter	fields, please refer to the help file.		
	<b>UDP</b> : selects UDP to filter IPv4 UDP protocol frames. Extra fields for		
	defining UDP parameters will appear. For more details of these fields,		
	please refer to the help file.		
	TCP: selects TCP to filter IPv4 TCP protocol frames. Extra fields for		
	defining TCP parameters will appear. For more details of these fields,		
	please refer to the help file.		
IP Protocol Value	Specific allows you to enter a specific value. The allowed range is 0		
ir Protocol value	to 255. Frames matching the ACE will use this IP protocol value.		
	Specifies the time-to-live settings for the ACE		
	Zero: IPv4 frames with a time-to-live value greater than zero must		
IP TTL	not be able to match this entry.		
I I I I L	Non-zero: IPv4 frames with a time-to-live field greater than zero		
	must be able to match this entry.		
	Any: any value is allowed ("don't-care").		
	Specifies the fragment offset settings for the ACE. This includes		
	settings of More Fragments (MF) bit and Fragment Offset (FRAG		
	OFFSET) for an IPv4 frame.		
IP Fragment	No: IPv4 frames whose MF bit is set or the FRAG OFFSET field is		
ir Fragilient	greater than zero must not be able to match this entry.		
	Yes: IPv4 frames whose MF bit is set or the FRAG OFFSET field is		
	greater than zero must be able to match this entry.		
	Any: any value is allowed ("don't-care").		
	Specifies the options flag settings for the ACE		
IP Option	<b>No</b> : IPv4 frames whose options flag is set must not be able to match		
	this entry.		
	Yes: IPv4 frames whose options flag is set must be able to match this		
	entry.		
	Any: any value is allowed ("don't-care").		
SIP Filter	Specifies the source IP filter for this ACE		

	Any: no source IP filter is specified (Source IP filter is "don't-care").	
	Host: source IP filter is set to Host. Specify the source IP address in	
	the SIP Address field that appears.	
	Network: source IP filter is set to Network. Specify the source IP	
	address and source IP mask in the SIP Address and SIP Mask fields	
	that appear.	
CID Address	When Host or Network is selected for the source IP filter, you can	
SIP Address	enter a specific SIP address in dotted decimal notation.	
CID Magle	When Network is selected for the source IP filter, you can enter a	
SIP Mask	specific SIP mask in dotted decimal notation.	
	Specifies the destination IP filter for the ACE	
	Any: no destination IP filter is specified (destination IP filter is	
	"don't-care").	
	Host: destination IP filter is set to Host. Specify the destination IP	
DIP Filter	address in the <b>DIP Address</b> field that appears.	
	Network: destination IP filter is set to Network. Specify the	
	destination IP address and destination IP mask in the DIP Address	
	and DIP Mask fields that appear.	
DIP Address	When Host or Network is selected for the destination IP filter, you	
DIP Address	can enter a specific DIP address in dotted decimal notation.	
DID Mack	When <b>Network</b> is selected for the destination IP filter, you can enter	
DIP Mask	a specific DIP mask in dotted decimal notation.	

## **ARP Parameters**

ARP/RARP	Other 💌
Request/Reply	Request 💌
Sender IP Filter	Network 💌
Sender IP Address	192.168.1.1
Sender IP Mask	255.255.255.0
Target IP Filter	Network 💌
Target IP Address	192.168.1.254
Target IP Mask	255.255.255.0

ARP SMAC Match	1	~
RARP SMAC Match	1	~
IP/Ethernet Length	Any	~
IP	0	~
Ethernet	1	Y

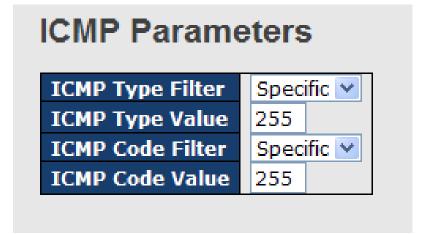

Label	Description
	Specifies the available ARP/RARP opcode (OP) flag for the ACE
ARP/RARP	Any: no ARP/RARP OP flag is specified (OP is "don't-care").
	ARP: frame must have ARP/RARP opcode set to ARP

	<b>RARP</b> : frame must have ARP/RARP opcode set to RARP.	
	Other: frame has unknown ARP/RARP Opcode flag.	
	Specifies the available ARP/RARP opcode (OP) flag for the ACE	
	<b>Any</b> : no ARP/RARP OP flag is specified (OP is "don't-care").	
Request/Reply	Request: frame must have ARP Request or RARP Request OP flag	
	set.	
	Reply: frame must have ARP Reply or RARP Reply OP flag.	
	Specifies the sender IP filter for the ACE	
	Any: no sender IP filter is specified (sender IP filter is "don't-care").	
	Host: sender IP filter is set to Host. Specify the sender IP address in	
Sender IP Filter	the SIP Address field that appears.	
	Network: sender IP filter is set to Network. Specify the sender IP	
	address and sender IP mask in the SIP Address and SIP Mask	
	fields that appear.	
Sender IP Address	When Host or Network is selected for the sender IP filter, you can	
Sender if Address	enter a specific sender IP address in dotted decimal notation.	
Candar ID Maak	When Network is selected for the sender IP filter, you can enter a	
Sender IP Mask	specific sender IP mask in dotted decimal notation.	
	Specifies the target IP filter for the specific ACE	
	Any: no target IP filter is specified (target IP filter is "don't-care").	
	Host: target IP filter is set to Host. Specify the target IP address in	
Target IP Filter	the Target IP Address field that appears.	
	Network: target IP filter is set to Network. Specify the target IP	
	address and target IP mask in the Target IP Address and Target IP	
	Mask fields that appear.	
Target IP Address	When Host or Network is selected for the target IP filter, you can	
rarget if Address	enter a specific target IP address in dotted decimal notation.	
Townet ID Mook	When Network is selected for the target IP filter, you can enter a	
Target IP Mask	specific target IP mask in dotted decimal notation.	
	Specifies whether frames will meet the action according to their	
ARP SMAC Match	sender hardware address field (SHA) settings.	
	0: ARP frames where SHA is not equal to the SMAC address	
	1: ARP frames where SHA is equal to the SMAC address	
	Any: any value is allowed ("don't-care").	
DADD CMAC	Specifies whether frames will meet the action according to their	
RARP SMAC	target hardware address field (THA) settings.	
Match	<b>0</b> : RARP frames where THA is not equal to the SMAC address	

	1: RARP frames where THA is equal to the SMAC address	
	Any: any value is allowed ("don't-care")	
	Specifies whether frames will meet the action according to their	
	ARP/RARP hardware address length (HLN) and protocol address	
	length (PLN) settings.	
IP/Ethernet	0: ARP/RARP frames where the HLN is equal to Ethernet (0x06) and	
Length	the (PLN) is equal to IPv4 (0x04) must not match this entry.	
	1: ARP/RARP frames where the HLN is equal to Ethernet (0x06) and	
	the (PLN) is equal to IPv4 (0x04) must match this entry.	
	Any: any value is allowed ("don't-care").	
	Specifies whether frames will meet the action according to their	
	ARP/RARP hardware address space (HRD) settings.	
	0: ARP/RARP frames where the HLD is equal to Ethernet (1) must	
IP	not match this entry.	
	1: ARP/RARP frames where the HLD is equal to Ethernet (1) must	
	match this entry.	
	Any: any value is allowed ("don't-care").	
	Specifies whether frames will meet the action according to their	
	ARP/RARP protocol address space (PRO) settings.	
	0: ARP/RARP frames where the PRO is equal to IP (0x800) must not	
Ethernet	match this entry.	
	1: ARP/RARP frames where the PRO is equal to IP (0x800) must	
	match this entry.	
	Any: any value is allowed ("don't-care").	

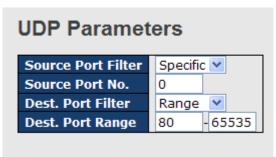

Label Description	
-------------------	--

	Specifies the ICMP filter for the ACE
	Any: no ICMP filter is specified (ICMP filter status is "don't-care").
ICMP Type Filter	Specific: if you want to filter a specific ICMP filter with the ACE, you
	can enter a specific ICMP value. A field for entering an ICMP value
	appears.
	When Specific is selected for the ICMP filter, you can enter a
ICMP Type Value	specific ICMP value. The allowed range is 0 to 255. A frame matching
	the ACE will use this ICMP value.
	Specifies the ICMP code filter for the ACE
	Any: no ICMP code filter is specified (ICMP code filter status is
ICMP Codo Filtor	"don't-care").
ICMP Code Filter	Specific: if you want to filter a specific ICMP code filter with the ACE,
	you can enter a specific ICMP code value. A field for entering an
	ICMP code value appears.
	When <b>Specific</b> is selected for the ICMP code filter, you can enter a
ICMP Code Value	specific ICMP code value. The allowed range is 0 to 255. A frame
	matching the ACE will use this ICMP code value.

Label	Description
	Specifies the TCP/UDP source filter for the ACE
	Any: no TCP/UDP source filter is specified (TCP/UDP source filter
TCP/UDP Source	status is "don't-care").
Filter	Specific: if you want to filter a specific TCP/UDP source filter with the
	ACE, you can enter a specific TCP/UDP source value. A field for
	entering a TCP/UDP source value appears.

	Range: if you want to filter a specific TCP/UDP source range filter
	with the ACE, you can enter a specific TCP/UDP source range. A
	field for entering a TCP/UDP source value appears.
	When <b>Specific</b> is selected for the TCP/UDP source filter, you can
TCP/UDP Source	enter a specific TCP/UDP source value. The allowed range is 0 to
No.	65535. A frame matching the ACE will use this TCP/UDP source
	value.
	When <b>Range</b> is selected for the TCP/UDP source filter, you can enter
TCP/UDP Source	a specific TCP/UDP source range value. The allowed range is 0 to
Range	65535. A frame matching the ACE will use this TCP/UDP source
	value.
	Specifies the TCP/UDP destination filter for the ACE
	Any: no TCP/UDP destination filter is specified (TCP/UDP
	destination filter status is "don't-care").
TCP/UDP	Specific: if you want to filter a specific TCP/UDP destination filter
Destination Filter	with the ACE, you can enter a specific TCP/UDP destination value. A
Destination Filter	field for entering a TCP/UDP destination value appears.
	Range: if you want to filter a specific range TCP/UDP destination
	filter with the ACE, you can enter a specific TCP/UDP destination
	range. A field for entering a TCP/UDP destination value appears.
TOD/UDD	When Specific is selected for the TCP/UDP destination filter, you
TCP/UDP	can enter a specific TCP/UDP destination value. The allowed range
Destination	is 0 to 65535. A frame matching the ACE will use this TCP/UDP
Number	destination value.
	When Range is selected for the TCP/UDP destination filter, you can
TCP/UDP	enter a specific TCP/UDP destination range value. The allowed
Destination Range	range is 0 to 65535. A frame matching the ACE will use this
	TCP/UDP destination value.
	Specifies the TCP FIN ("no more data from sender") value for the
	ACE.
TCP FIN	<b>0</b> : TCP frames where the FIN field is set must not be able to match
	this entry.
	1: TCP frames where the FIN field is set must be able to match this
	entry.
	Any: any value is allowed ("don't-care").
	Specifies the TCP SYN ("synchronize sequence numbers") value for
TCP SYN	the ACE
	1107.02

	<b>0</b> : TCP frames where the SYN field is set must not be able to match
	this entry.
	1: TCP frames where the SYN field is set must be able to match this
	entry.
	Any: any value is allowed ("don't-care").
	Specifies the TCP PSH ("push function") value for the ACE
	0: TCP frames where the PSH field is set must not be able to match
TOD DOLL	this entry.
TCP PSH	1: TCP frames where the PSH field is set must be able to match this
	entry.
	Any: any value is allowed ("don't-care").
	Specifies the TCP ACK ("acknowledgment field significant") value for
	the ACE
	0: TCP frames where the ACK field is set must not be able to match
TCP ACK	this entry.
	1: TCP frames where the ACK field is set must be able to match this
	entry.
	Any: any value is allowed ("don't-care").
	Specifies the TCP URG ("urgent pointer field significant") value for
	the ACE
	<b>0</b> : TCP frames where the URG field is set must not be able to match
TCP URG	this entry.
	1: TCP frames where the URG field is set must be able to match this
	entry.
	Any: any value is allowed ("don't-care").

#### 5.8.4 Authentication, Authorization, and Accounting

An AAA server is an application that provides authentication, authorization, and accounting services for attempted access to a network. An AAA server can reside in a dedicated computer, an Ethernet switch, an access point or a network access server. The current standard by which devices or applications communicate with an AAA server is RADIUS (Remote Authentication Dial-In User Service). RADIUS is a protocol used between the switch and the authentication server. This page allows you to configure common settings for an authentication server.

### **Authentication Server Configuration**

Common Server Configuration

Timeout	15	seconds
Dead Time	300	seconds

Label	Description
	The timeout, which can be set to a number between 3 and 3600
	seconds, is the maximum time to wait for a reply from a server.
	If the server does not reply within this time frame, we will consider it
	to be dead and continue with the next enabled server (if any).
Timequit	RADIUS servers are using the UDP protocol, which is unreliable by
Timeout	design. In order to cope with lost frames, the timeout interval is
	divided into 3 subintervals of equal length. If a reply is not received
	within the subinterval, the request is transmitted again. This
	algorithm causes the RADIUS server to be queried up to 3 times
	before it is considered to be dead.
	The dead time, which can be set to a number between 0 and 3600
	seconds, is the period during which the switch will not send new
	requests to a server that has failed to respond to a previous request.
Dead Time	This will stop the switch from continually trying to contact a server
	that it has already determined as dead.
	Setting the dead time to a value greater than 0 (zero) will enable this
	feature, but only if more than one server has been configured.

#### **5.8.5 RADIUS**

#### **Authentication and Accounting Server**

When a user requests network connection, a RADIUS client which receives the request will perform an initial access negotiation with the user to obtain identity/password information. The client then passes the information to a RADIUS server as part of an authentication/authorization request.

The RADIUS server matches data from the authentication/authorization request with information in a trusted database. If a match is found and the user's credentials are correct, the RADIUS server sends an accept message to the client to grant access. If a match is not found or a problem is found with the user's credentials, the server returns a reject message to deny access. The NAD then establishes or terminates the user's connection. The NAD may then

forward accounting information to the RADIUS server to document the transaction; the RADIUS server may store or forward this information as needed to support billing for the services provided.

#### **RADIUS Authentication Server Configuration** # Enabled IP Address Secret Port 1 1812 1812 3 1812 1812 1812 5

Label	Description
#	The RADIUS authentication server number for which the
"	configuration below applies.
Enabled	Check to enable the RADIUS authentication server.
IP Address	The IP address or hostname of the RADIUS authentication server. IP
IF Address	address is expressed in dotted decimal notation.
	The UDP port to use on the RADIUS authentication server. If the port
Port	is set to <b>0</b> (zero), the default port (1812) is used on the RADIUS
	authentication server.
	The secret is a text string used by RADIUS to encrypt the client and
	server authenticator field during exchanges between the router and a
Secret	RADIUS authentication server. The router encrypts PPP PAP
	passwords using this text string. The secret - up to 29 characters
	long - shared between the RADIUS authentication server and the
	switch stack.

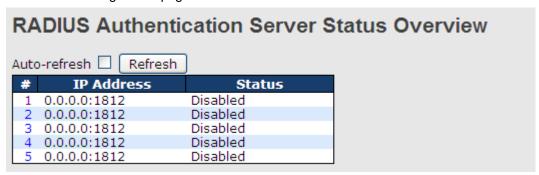

#### **RADIUS Accounting Server Configuration** Enabled IP Address **Port** Secret 1813 1813 2 3 1813 4 1813 1813 Save Reset

Label	Description
#	The RADIUS accounting server number for which the configuration
#	below applies.
Enabled	Check to enable the RADIUS accounting server
IP Address	The IP address or hostname of the RADIUS accounting server. IP
IF Address	address is expressed in dotted decimal notation.
	The UDP port to use on the RADIUS accounting server. If the port is
Port	set to <b>0</b> (zero), the default port (1813) is used on the RADIUS
	accounting server.
	The secret is a text string used by RADIUS to encrypt the client and
	server authenticator field during exchanges between the router and a
Secret	RADIUS authentication server. The router encrypts PPP PAP
	passwords using this text string. The secret - up to 29 characters
	long - shared between the RADIUS authentication server and the
	switch stack.

#### **Authentication and Accounting Server Status**

This page provides information about the status of the RADIUS server configurable on the authentication configuration page.

Label	Description
#	The RADIUS server number. Click to navigate to detailed statistics of
#	the server
IP Address	The IP address and UDP port number (in <ip address="">:<udp port=""></udp></ip>
IF Address	notation) of the server
	The current status of the server. This field has one of the following
	values:
Status	Disabled: the server is disabled.
	Not Ready: the server is enabled, but IP communication is not yet up
	and running.

**Ready**: the server is enabled, IP communications are built, and the RADIUS module is ready to accept access attempts.

**Dead** (X seconds left): access attempts are made to this server, but it does not reply within the configured timeout. The server has temporarily been disabled, but will be re-enabled when the dead-time expires. The number of seconds left before this occurs is displayed in parentheses. This state is only reachable when more than one server is enabled.

## **RADIUS Accounting Server Status Overview**

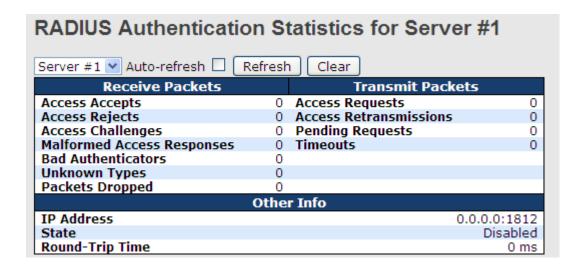

#	IP Address	Status
1	0.0.0.0:1813	Disabled
2	0.0.0.0:1813	Disabled
3	0.0.0.0:1813	Disabled
4	0.0.0.0:1813	Disabled
- 5	0.0.0.0:1813	Disabled

Label	Description
#	The RADIUS server number. Click to navigate to detailed statistics of
#	the server
IP Address	The IP address and UDP port number (in <ip address="">:<udp port=""></udp></ip>
IP Address	notation) of the server
	The current status of the server. This field has one of the following
	values:
	Disabled: the server is disabled.
	Not Ready: the server is enabled, but IP communication is not yet up
	and running.
	Ready: the server is enabled, IP communication is up and running,
Status	and the RADIUS module is ready to accept accounting attempts.
	Dead (X seconds left): accounting attempts are made to this server,
	but it does not reply within the configured timeout. The server has
	temporarily been disabled, but will be re-enabled when the dead-time
	expires. The number of seconds left before this occurs is displayed in
	parentheses. This state is only reachable when more than one server
	is enabled.

#### **Authentication and Accounting Server Statistics**

This page shows the access statistics of the authentication and accounting servers. Use the server drop-down list to switch between the backend servers to show related details.

Label	Description				
	RADIUS auth	entication server packet	counters. There are seven		
	'receive' and fo	our 'transmit' counters.			
	Direction Name	RFC4668 Name	Description		
	Rx Access Acce		The number of RADIUS Access-Accept packets (valid or invalid) received from the server.		
	Rx Access Reje	cts radiusAuthClientExtAccessRejects	The number of RADIUS Access-Reject packets (valid or invalid) received from the server.		
	Rx Access Challenges	radiusAuthClientExtAccessChallenges	The number of RADIUS Access-Challenge packets (valid or invalid) received from the server.		
	Malformed Rx Access Responses	radiusAuthClientExtMalformedAccessRespo	The number of malformed RADIUS Access- Response packets received from the server. Malformed packets include packets with an invalid length. Bad authenticators or Message Authenticator attributes or unknown types are not included as malformed access responses.		
	Rx Bad Authenticate	radiusAuthClientExtBadAuthenticators	The number of RADIUS Access-Response packets containing invalid authenticators or Message Authenticator attributes received from the server.		
Packet Counters	Rx Unknown Ty	rpes radiusAuthClientExtUnknownTypes	The number of RADIUS packets that were received from the server on the authentication port and dropped for some other reason.		
	Rx Packets Dro	pped radiusAuthClientExtPacketsDropped	The number of RADIUS packets that were received from the server on the authentication port and dropped for some other reason.		
	Tx Access Requ	radiusAuthClientExtAccessRequests	The number of RADIUS Access-Request packets sent to the server. This does not include retransmissions.		
	Tx Access Retransmiss	ions radiusAuthClientExtAccessRetransmissions	The number of RADIUS Access-Request packets retransmitted to the RADIUS authentication server.		
	Tx Pending Req	<b>uests</b> radiusAuthClientExtPendingRequests	The number of RADIUS Access-Request packets destined for the server that have not yet timed out or received a response. This variable is incremented when an Access-Request is sent and decremented due to receipt of an Access-Accept, Access-Reject, Access-Challenge, timeout, or retransmission.		
	Tx Timeouts	radiusAuthClientExtTimeouts	The number of authentication timeouts to the server. After a timeout, the client may retry to the same server, send to a different server, or give up. A retry to the same server is counted as a retransmit as well as a timeout. A send to a different server is counted as a Request as well as a timeout.		

RADIUS Accounting Statistics for Server #1			
Receive Packets		Transmit P	ackets
Responses	0	Requests	0
Malformed Responses	0	Retransmissions	0
Bad Authenticators	0	Pending Requests	0
Unknown Types	0	Timeouts	0
Packets Dropped	0

#### 5.8.6 NAS (802.1x)

A NAS (Network Access Server) is an access gateway between an external communications network and an internal network. For example, when the user dials into the ISP, he/she will be given access to the Internet after being authorized by the access server. The authentication between the client and the server include IEEE 802.1X- and MAC-based.

The IEEE 802.1X standard defines a port-based access control procedure that prevents unauthorized access to a network by requiring users to first submit credentials for authentication. One or more backend servers (RADIUS) determine whether the user is allowed access to the network.

MAC-based authentication allows for authentication of more than one user on the same port, and does not require the users to have special 802.1X software installed on their system. The switch uses the users' MAC addresses to authenticate against the backend server. As intruders can create counterfeit MAC addresses, MAC-based authentication is less secure than 802.1X authentication.

#### Overview of 802.1X (Port-Based) Authentication

In an 802.1X network environment, the user is called the supplicant, the switch is the authenticator, and the RADIUS server is the authentication server. The switch acts as the man-in-the-middle, forwarding requests and responses between the supplicant and the authentication server. Frames sent between the supplicant and the switch are special 802.1X frames, known as EAPOL (EAP Over LANs) frames which encapsulate EAP PDUs (RFC3748). Frames sent between the switch and the RADIUS server are RADIUS packets. RADIUS packets also encapsulate EAP PDUs together with other attributes like the switch's IP address, name, and the supplicant's port number on the switch. EAP is very flexible as it allows for different authentication methods, like MD5-Challenge, PEAP, and TLS. The important thing is that the authenticator (the switch) does not need to know which authentication method the supplicant and the authentication server are using, or how many information exchange frames are needed for a particular method. The switch simply encapsulates the EAP part of the frame

into the relevant type (EAPOL or RADIUS) and forwards it.

When authentication is complete, the RADIUS server sends a special packet containing a success or failure indication. Besides forwarding the result to the supplicant, the switch uses it to open up or block traffic on the switch port connected to the supplicant.

Note: in an environment where two backend servers are enabled, the server timeout is configured to X seconds (using the authentication configuration page), and the first server in the list is currently down (but not considered dead), if the supplicant retransmits EAPOL Start frames at a rate faster than X seconds, it will never be authenticated because the switch will cancel on-going backend authentication server requests whenever it receives a new EAPOL Start frame from the supplicant. Since the server has not failed (because the X seconds have not expired), the same server will be contacted when the next backend authentication server request from the switch. This scenario will loop forever. Therefore, the server timeout should be smaller than the supplicant's EAPOL Start frame retransmission rate.

#### Overview of MAC-Based Authentication

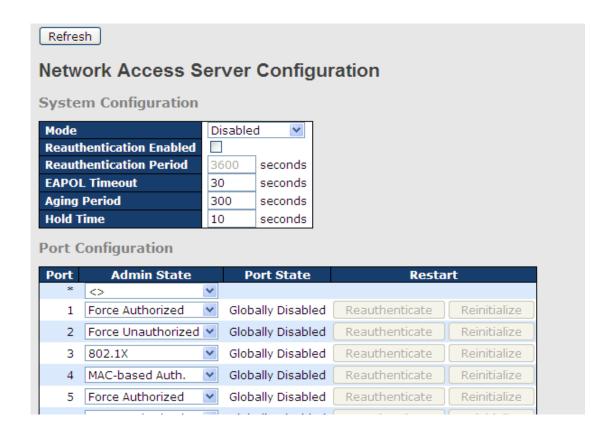

Unlike 802.1X, MAC-based authentication is not a standard, but merely a best-practices method adopted by the industry. In MAC-based authentication, users are called clients, and the switch acts as the supplicant on behalf of clients. The initial frame (any kind of frame) sent by a client is snooped by the switch, which in turn uses the client's MAC address as both username and password in the subsequent EAP exchange with the RADIUS server. The 6-byte MAC address is converted to a string in the following form "xx-xx-xx-xx-xx-xx", that is, a dash (-) is used as separator between the lower-cased hexadecimal digits. The switch only supports the MD5-Challenge authentication method, so the RADIUS server must be configured accordingly.

When authentication is complete, the RADIUS server sends a success or failure indication, which in turn causes the switch to open up or block traffic for that particular client, using static entries into the MAC Table. Only then will frames from the client be forwarded on the switch. There are no EAPOL frames involved in this authentication, and therefore, MAC-based authentication has nothing to do with the 802.1X standard.

The advantage of MAC-based authentication over 802.1X is that several clients can be connected to the same port (e.g. through a 3rd party switch or a hub) and still require individual authentication, and that the clients do npt need special supplicant software to authenticate. The disadvantage is that MAC addresses can be spoofed by malicious users, equipment whose MAC address is a valid RADIUS user can be used by anyone, and only the MD5-Challenge method is supported.

802.1X and MAC-Based authentication configurations consist of two sections: system- and port-wide.

Label	Description
Mode	Indicates if 802.1X and MAC-based authentication is globally enabled or disabled on the switch. If globally disabled, all ports
	are allowed to forward frames.
Reauthentication Enabled	If checked, clients are reauthenticated after the interval specified by the Reauthentication Period. Reauthentication for 802.1X-enabled ports can be used to detect if a new device is plugged into a switch port.  For MAC-based ports, reauthentication is only useful if the RADIUS server configuration has changed. It does not involve communication between the switch and the client, and therefore does not imply that a client is still present on a port (see Age Period below).
Reauthentication Period	Determines the period, in seconds, after which a connected client must be re-authenticated. This is only active if the <b>Reauthentication Enabled</b> checkbox is checked. Valid range of
EAPOL Timeout	the value is 1 to 3600 seconds.  Determines the time for retransmission of Request Identity EAPOL frames.

	Valid range of the value is 1 to 65535 seconds. This has no effect
	for MAC-based ports.
	· · · · · · · · · · · · · · · · · · ·
	This setting applies to the following modes, i.e. modes using the
	Port Security functionality to secure MAC addresses:
	MAC-Based Auth.:
	When the NAS module uses the Port Security module to secure
	MAC addresses, the Port Security module needs to check for
	activity on the MAC address in question at regular intervals and
Age Period	free resources if no activity is seen within a given period of time.
	This parameter controls exactly this period and can be set to a
	number between 10 and 1000000 seconds.
	For ports in MAC-based Auth. mode, reauthentication does not
	cause direct communications between the switch and the client,
	so this will not detect whether the client is still attached or not, and
	the only way to free any resources is to age the entry.
	This setting applies to the following modes, i.e. modes using the
	Port Security functionality to secure MAC addresses:
	MAC-Based Auth.:
	If a client is denied access - either because the RADIUS server
	denies the client access or because the RADIUS server request
	times out (according to the timeout specified on the
Hold Time	"Configuration→Security→AAA" page) - the client is put on
	hold in Unauthorized state. The hold timer does not count during
	an on-going authentication.
	The switch will ignore new frames coming from the client during
	the hold time.
	The hold time can be set to a number between 10 and 1000000
Port	seconds.  The port number for which the configuration below applies
FOIL	If NAS is globally enabled, this selection controls the port's
	authentication mode. The following modes are available:
	Force Authorized
Admin State	In this mode, the switch will send one EAPOL Success frame
	when the port link is up, and any client on the port will be allowed
	network access without authentication.
	Force Unauthorized
	In this mode, the switch will send one EAPOL Failure frame when

the port link is up, and any client on the port will be disallowed network access.

#### Port-based 802.1X

In an 802.1X network environment, the user is called the supplicant, the switch is the authenticator, and the RADIUS server is the authentication server. The authenticator acts as the man-in-the-middle, forwarding requests and responses between the supplicant and the authentication server. Frames sent between the supplicant and the switch are special 802.1X frames, known as EAPOL (EAP Over LANs) frames which encapsulate EAP PDUs (RFC3748). Frames sent between the switch and the RADIUS server is RADIUS packets. RADIUS packets also encapsulate EAP PDUs together with other attributes like the switch's IP address, name, and the supplicant's port number on the switch. EAP is very flexible as it allows for different authentication methods, like MD5-Challenge, PEAP, and TLS. The important thing is that the authenticator (the switch) does not need to know which authentication method the supplicant and the authentication server are using, or how many information exchange frames are needed for a particular method. The switch simply encapsulates the EAP part of the frame into the relevant type (EAPOL or RADIUS) and forwards it.

When authentication is complete, the RADIUS server sends a special packet containing a success or failure indication. Besides forwarding the result to the supplicant, the switch uses it to open up or block traffic on the switch port connected to the supplicant. Note: in an environment where two backend servers are enabled, the server timeout is configured to X seconds (using the authentication configuration page), and the first server in the list is currently down (but not considered dead), if the supplicant retransmits EAPOL Start frames at a rate faster than X seconds, it will never be authenticated because the switch will cancel on-going backend authentication server requests whenever it receives a new EAPOL Start frame from the supplicant. Since the server has not failed (because the X seconds have not expired), the same server will be contacted when the next backend authentication server request from the switch This scenario will

loop forever. Therefore, the server timeout should be smaller than the supplicant's EAPOL Start frame retransmission rate.

#### a. Single 802.1X

In port-based 802.1X authentication, once a supplicant is successfully authenticated on a port, the whole port is opened for network traffic. This allows other clients connected to the port (for instance through a hub) to piggy-back on the successfully authenticated client and get network access even though they are not authenticated individually. To overcome this security breach, use the Single 802.1X variant.

Single 802.1X is not yet an IEEE standard, but features many of the same characteristics as port-based 802.1X. In Single 802.1X, at most one supplicant can get authenticated on the port at a time. Normal EAPOL frames are used in the communications between the supplicant and the switch. If more than one supplicant are connected to a port, the one that comes first when the port's link is connected will be the first one considered. If that supplicant does not provide valid credentials within a certain amount of time, the chance will be given to another supplicant. Once a supplicant is successfully authenticated, only that supplicant will be allowed access. This is the most secure of all the supported modes. In this mode, the Port Security module is used to secure a supplicant's MAC address once successfully authenticated.

#### b. Multi 802.1X

In port-based 802.1X authentication, once a supplicant is successfully authenticated on a port, the whole port is opened for network traffic. This allows other clients connected to the port (for instance through a hub) to piggy-back on the successfully authenticated client and get network access even though they are not authenticated individually. To overcome this security breach, use the Multi 802.1X variant.

Multi 802.1X is not yet an IEEE standard, but features many of the same characteristics as port-based 802.1X. In Multi 802.1X, one or more supplicants can be authenticated on the same port at the same time. Each supplicant is authenticated individually and secured in the MAC table using the Port Security module.

In Multi 802.1X it is not possible to use the multicast BPDU MAC

address as the destination MAC address for EAPOL frames sent from the switch to the supplicant, since that would cause all supplicants attached to the port to reply to requests sent from the switch. Instead, the switch uses the supplicant's MAC address, which is obtained from the first EAPOL Start or EAPOL Response Identity frame sent by the supplicant. An exception to this is when no supplicants are attached. In this case, the switch sends EAPOL Request Identity frames using the BPDU multicast MAC address as destination - to wake up any supplicants that might be on the port.

The maximum number of supplicants that can be attached to a port can be limited using the Port Security Limit Control functionality.

#### MAC-based Auth.

Unlike port-based 802.1X, MAC-based authentication is not a standard, but merely a best-practices method adopted by the industry. In MAC-based authentication, users are called clients, and the switch acts as the supplicant on behalf of clients. The initial frame (any kind of frame) sent by a client is snooped by the switch, which in turn uses the client's MAC address as both username and password in the subsequent EAP exchange with the RADIUS server. The 6-byte MAC address is converted to a string in the following form "xx-xx-xx-xx-xx", that is, a dash (-) is used as separator between the lower-cased hexadecimal digits. The switch only supports the MD5-Challenge authentication method, so the RADIUS server must be configured accordingly. When authentication is complete, the RADIUS server sends a success or failure indication, which in turn causes the switch to open up or block traffic for that particular client, using the Port Security module. Only then will frames from the client be forwarded on the switch. There are no EAPOL frames involved in this authentication, and therefore, MAC-based authentication has nothing to do with the 802.1X standard.

The advantage of MAC-based authentication over port-based 802.1X is that several clients can be connected to the same port (e.g. through a 3rd party switch or a hub) and still require individual authentication, and that the clients don't need special

	supplicant software to authenticate. The advantage of
	supplicant software to authenticate. The advantage of MAC-based authentication over 802.1X-based authentication is
	that the clients do not need special supplicant software to
	authenticate. The disadvantage is that MAC addresses can be
	spoofed by malicious users - equipment whose MAC address is a
	valid RADIUS user can be used by anyone. Also, only the
	MD5-Challenge method is supported. The maximum number of
	clients that can be attached to a port can be limited using the Port
	Security Limit Control functionality.
	The current state of the port. It can undertake one of the following
	values:
	Globally Disabled: NAS is globally disabled.
	Link Down: NAS is globally enabled, but there is no link on the
	port.
	Authorized: the port is in Force Authorized or a single-supplicant
Port State	mode and the supplicant is authorized.
	Unauthorized: the port is in Force Unauthorized or a
	single-supplicant mode and the supplicant is not successfully
	authorized by the RADIUS server.
	X Auth/Y Unauth: the port is in a multi-supplicant mode.
	Currently X clients are authorized and Y are unauthorized.
	Two buttons are available for each row. The buttons are only
	enabled when authentication is globally enabled and the port's
	Admin State is in an EAPOL-based or MAC-based mode.
	Clicking these buttons will not cause settings changed on the
	page to take effect.
	Reauthenticate: schedules a reauthentication whenever the
	quiet-period of the port runs out (EAPOL-based authentication).
Restart	For MAC-based authentication, reauthentication will be attempted
rtootart	immediately.
	The button only has effect on successfully authenticated clients
	on the port and will not cause the clients to be temporarily
	unauthorized.
	Reinitialize: forces a reinitialization of the clients on the port and
	hence a reauthentication immediately. The clients will transfer to
	the unauthorized state while the reauthentication is in progress.

#### **NAS Status**

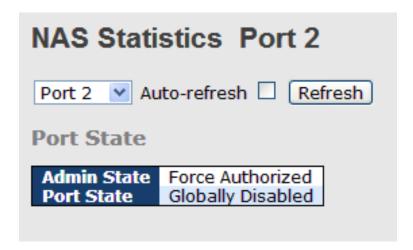

This page shows the information on current NAS port statuses.

## Auto-refresh Refresh Port Admin State Port State Last Source Last ID 1 Force Authorized Globally Disabled 2 Force Authorized Globally Disabled 3 Force Authorized Globally Disabled 4 Force Authorized Globally Disabled 5 Force Authorized Globally Disabled 5 Force Authorized Globally Disabled 6 Force Authorized Globally Disabled 6 Force Authorized Globally Disabled

## 5.9 Alerts

#### 5.9.1 Fault Alarm

When any selected fault event happens, the Fault LED on the switch panel will light up and the electric relay will signal at the same time. The following pages allow you to set up alert conditions based on your needs for individual switch ports, including actions to be taken during disconnection and power failure.

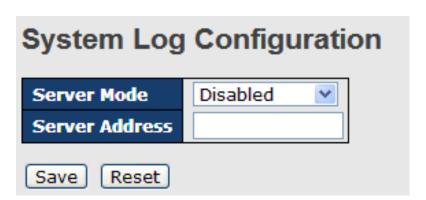

## **5.9.2 System Warning SYSLOG Setting**

SYSLOG is a protocol that allows a device to send event notification messages across IP networks to event message collectors. It permits separation of the software that generates messages from the system that stores them and the software that reports and analyzes them. As Syslog messages are UDP-based, the sender and receiver will not be aware of it if the packet is lost due to network disconnection and no UDP packet will be resent.

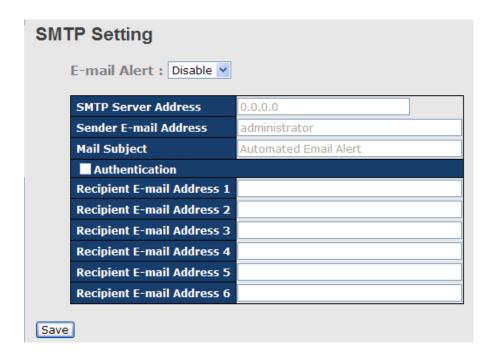

Label	Description								
Server Mode	Indicates existing server mode. When the mode operation								
	is enabled, the syslog message will be sent to syslog								
	server. The syslog protocol is based on UDP								
	communications and received on UDP port 514 and the								
	syslog server will not send acknowledgments back to the								

	sender since UDP is a connectionless protocol and it does							
	not provide acknowledgments. The syslog packet will							
	always be sent even if the syslog server does not exist.							
	Possible modes are:							
	Enabled: enable server mode							
	Disabled: disable server mode							
SYSLOG Server IP Address	Indicates the IPv4 host address of syslog server. If the							
	switch provides DNS functions, it also can be a host name.							

#### **SMTP Setting**

SMTP (Simple Mail Transfer Protocol) is a protocol for transmitting e-mails across the Internet. By setting up SMTP alert, the device will send a notification e-mail when a user-defined event occurs.

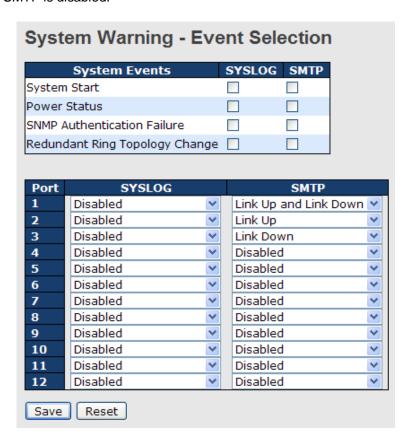

Label	Description					
E-mail Alarm	Enables or disables transmission of system warnings by e-mail					
Sender E-mail	SMTP server IP address					
Address						
Mail Subject	Subject of the mail					
Authentication	■ Username: the authentication username					
	■ Password: the authentication password					
	■ Confirm Password: re-enter password					
Recipient E-mail	The recipient's e-mail address. A mail allows for 6 recipients.					

Address	
Apply	Click to activate the configurations
Help	Shows help file

#### **Event Selection**

The device supports both SYSLOG and SMTP alerts. Check the corresponding box to enable the system event warning method you want. Please note that the checkboxes will gray out if SYSLOG or SMTP is disabled.

Label	Description
System Cold Start	Sends out alerts when the system is restarted
Power Status	Sends out alerts when power is up or down
SNMP Authentication	Sends out alert when SNMP authentication fails
Failure	
O-Ring Topology	Sends out alerts when O-Ring topology changes
Change	
Port Event	■ Disable
SYSLOG / SMTP	■ Link Up
event	■ Link Down

Help	Shows help file			

## 5.10 Monitor and Diag

#### **5.10.1 MAC Table**

A MAC address tablet is a table in a network switch that maps MAC addresses to ports. The switch uses the table to determine which port the incoming packet should be forwarded to. Entries in a MAC address table fall into two types: dynamic and static entries. Entries in a static MAC table are added or removed manually and cannot age out by themselves. Entries in a dynamic MAC tablet will age out after a configured aging time. Such entries can be added by learning or manual configuration.

#### **Aging Configuration**

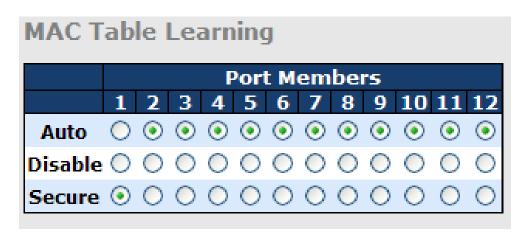

Aging enables the switch to track only active MAC addresses on the network and flush out MAC addresses that are no longer used, thereby keeping the table current. By default, aged entries are removed after 300 seconds. You can configure aging time by entering a value in the **Age Time** box in seconds. The allowed range is 10 to 1000000 seconds. You can also disable

the automatic aging of dynamic entries by checking Disable Automatic Aging.

#### **MAC Table Learning**

The switch can add the address and port on which the packet was received to the MAC table if the address does not exist in the table by examining the source address of each packet received on a port. This is called learning. It allows the MAC table to expand dynamically. If the learning mode for a given port is grayed out, it means another module is in control of the mode, and thus the user cannot change the configurations. An example of such a module is MAC-Based authentication under 802.1X.

Label	Description
Auto	Learning is done automatically as soon as a frame with unknown
Auto	SMAC is received.
Disable	No learning is done.
	Only static MAC entries are learned, all other frames are dropped.
	Note: make sure the link used for managing the switch is added to
Sagura	the static Mac table before changing to secure learning mode,
Secure	otherwise the management link will be lost and can only be
	restored by using another non-secure port or by connecting to the
	switch via the serial interface.

#### **Static MAC Table Configurations**

This tablet shows the static entries in the MAC table which can contain up to 64 entries. Using static MAC address entries can reduce broadcast packets remarkably and are suitable for networks where network devices seldom change. You can manage the entries in this page. The MAC table is sorted first by VLAN ID and then by MAC address.

						F	ort	M	em	bei	15			
Delete	VLAN ID	MAC Address	1	2	3	4	5	6	7	8	9	10	11	12
	1	00-1E-94-98-89-89	<b>~</b>											
Delete	1	00-00-00-00-00												
Delete	1	00-00-00-00-00												
Add new static entry														

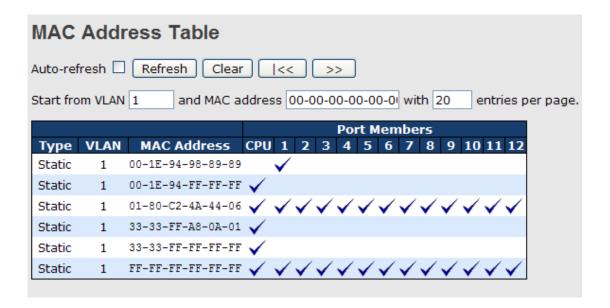

Label	Description				
Delete	Check to delete an entry. It will be deleted during the next save.				
VLAN ID	The VLAN ID for the entry				
MAC Address	The MAC address for the entry				
Port Members	Checkmarks indicate which ports are members of the entry.				
Port Wembers	Check or uncheck to modify the entry.				
Adding Now Statio	Click to add a new entry to the static MAC table. You can specify				
Adding New Static	the VLAN ID, MAC address, and port members for the new entry.				
Entry	Click <b>Save</b> to save the changes.				

#### **MAC Table**

Each page shows up to 999 entries from the MAC table, with a default value of 20, selected by the **Entries Per Page** input field. When first visited, the web page will show the first 20 entries from the beginning of the MAC Table. The first displayed will be the one with the lowest VLAN ID and the lowest MAC address found in the MAC Table.

The **Start from MAC address** and **VLAN** fields allow the user to select the starting point in the MAC table. Clicking **Refresh** will update the displayed table starting from that or the closest next MAC table match. In addition, the two input fields will – upon clicking **Refresh** - assume the value of the first displayed entry, allows for continuous refresh with the same start address. The >> button will use the last entry of the currently displayed VLAN/MAC address pairs as a basis for the next lookup. When it reaches the end, the text "**no more entries**" is shown in the displayed table. Use the **|<<** button to start over.

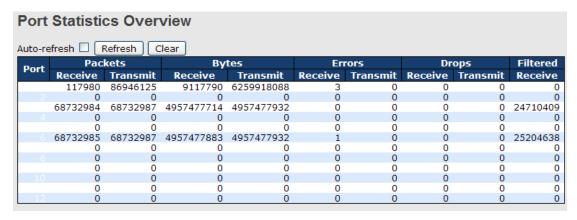

Label	Description		
Туре	Indicates whether the entry is a static or dynamic entry		
MAC address	The MAC address of the entry		
VLAN	The VLAN ID of the entry		
Port Members	The ports that are members of the entry.		

#### 5.10.2 Port Statistics

#### **Traffic Overview**

This page provides an overview of general traffic statistics for all switch ports.

Label	Description		
Port	The switch port number to which the following settings will be applied.		
Packets	The number of received and transmitted packets per port		
Bytes	The number of received and transmitted bytes per port		

Errors	The number of frames received in error and the number of	
	incomplete transmissions per port	
Drops	The number of frames discarded due to ingress or egress congestion	
Filtered	The number of received frames filtered by the forwarding process	
Auto-refresh	Check to enable an automatic refresh of the page at regular intervals.	
Refresh	Updates the counter entries, starting from the current entry ID.	
Clear	Flushes all counters entries	

#### **Detailed Statistics**

This page provides detailed traffic statistics for a specific switch port. Use the port drop-down list to decide the details of which switch port to be displayed.

The displayed counters include the total number for receive and transmit, the size for receive and transmit, and the errors for receive and transmit.

#### **Detailed Statistics - Total Receive & Transmit**

Rx 1527- Bytes	0	Tx 1527- Bytes	0
Receive Queue Counter	5	Transmit Queue Counters	
Rx Q0	0	Tx Q0	0
Rx Q1	0	Tx Q1	0
Rx Q2	0	Tx Q2	0
Rx Q3	0	Tx Q3	0
Rx Q4	0	Tx Q4	0
Rx Q5	0	Tx Q5	0
Rx Q6	0	Tx Q6	0
Rx Q7	0	Tx Q7	0
Receive Error Counters		Transmit Error Counters	
Rx Drops	0	Tx Drops	0
Rx CRC/Alignment	0	Tx Late/Exc. Coll.	0
Rx Undersize	0		
Rx Oversize	0		
Rx Fragments	0		
Rx Jabber	0		
Rx Filtered	0		

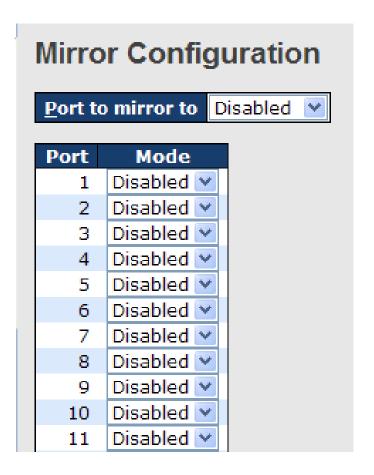

Label	Description		
Rx and Tx Packets	The number of received and transmitted (good and bad) packets		
Rx and Tx Octets	The number of received and transmitted (good and bad) bytes,		
	including FCS, except framing bits		
Dy and Ty Unique	The number of received and transmitted (good and bad) unicast		
Rx and Tx Unicast	packets		
Rx and Tx	The number of received and transmitted (good and bad) multicast		
Multicast	packets		
Rx and Tx	The number of received and transmitted (good and bad) broadcast		
Broadcast	packets		
Rx and Tx Pause	The number of MAC Control frames received or transmitted on this		
KX and IX Pause	port that have an opcode indicating a PAUSE operation		
D. Duana	The number of frames dropped due to insufficient receive buffer or		
Rx Drops	egress congestion		
Rx	The number of frames received with CRC or alignment errors		
CRC/Alignment			
Rx Undersize	The number of short <sup>1</sup> frames received with a valid CRC		
Rx Oversize	The number of long <sup>2</sup> frames received with a valid CRC		
Rx Fragments	The number of short <sup>1</sup> frames received with an invalid CRC		
Rx Jabber	The number of long <sup>2</sup> frames received with an invalid CRC		
Rx Filtered	The number of received frames filtered by the forwarding process		
Tx Drops	The number of frames dropped due to output buffer congestion		
Tx Late / Exc.Coll.	The number of frames dropped due to excessive or late collisions		

- 1. Short frames are frames smaller than 64 bytes.
- 2. Long frames are frames longer than the maximum frame length configured for this port.

### 5.10.3 Port Mirroring

Port mirroring function will copy the traffic of one port to another port on the same switch to allow the network analyzer attached to the mirror port to monitor and analyze packets. The function is useful for troubleshooting. To solve network problems, selected traffic can be copied or mirrored to a mirror port where a frame analyzer can be attached to analyze the frame flow. The traffic to be copied to the mirror port can be all frames received on a given port (also known as ingress or source mirroring) or all frames transmitted on a given port (also known as egress or destination mirroring). The port to which the monitored traffic is copied is called mirror port.

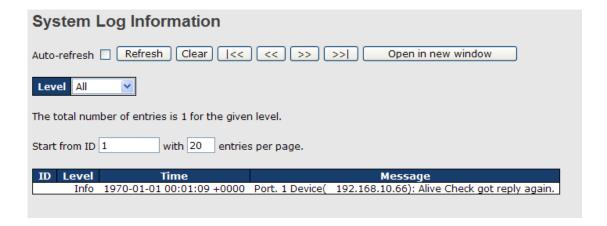

Label	Description		
Port	The switch port number to which the following settings will be		
	applied.		
	Drop-down list for selecting a mirror mode.		
	Rx only: only frames received on this port are mirrored to the mirror		
	port. Frames transmitted are not mirrored.		
	Tx only: only frames transmitted from this port are mirrored to the		
	mirror port. Frames received are not mirrored.		
Mode	Disabled: neither transmitted nor received frames are mirrored.		
Wiode	Enabled: both received and transmitted frames are mirrored to the		
	mirror port.		
	Note: for a given port, a frame is only transmitted once. Therefore,		
	you cannot mirror Tx frames to the mirror port. In this case, mode for		
	the selected mirror port is limited to <b>Disabled</b> or <b>Rx only</b> .		

### 5.10.4 System Log Information

This page provides switch system log information.

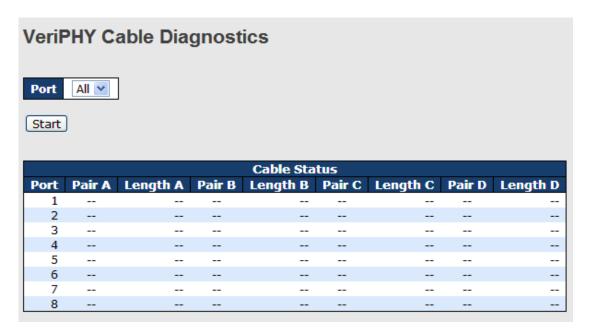

Label	Description				
ID	The ID (>= 1) of the system log entry				
	The level of the system log entry. The following level types are				
	supported:				
Laval	Info: provides general information				
Level	Warning: provides warning for abnormal operation				
	Error: provides error message				
	All: enables all levels				
Time	The time of the system log entry				
Message	The MAC address of the switch				
	Check this box to enable an automatic refresh of the page at regular				
Auto-refresh	intervals.				
Refresh	Updates system log entries, starting from the current entry ID				
Clear	Flushes all system log entries				
<b> </b> <<	Updates system log entries, starting from the first available entry ID				
	Updates system log entries, ending at the last entry currently				
<<	displayed				
>>	Updates system log entries, starting from the last entry currently				
	displayed.				
>>	Updates system log entries, ending at the last available entry ID.				

### **5.10.5 Cable Diagnostics**

You can perform cable diagnostics for all ports or selected ports to diagnose any cable faults (short, open etc.) and feedback a distance to the fault. Simply select the port from the drop-down list and click **Start** to run the diagnostics. This will take approximately 5 seconds. If all ports are selected, this can take approximately 15 seconds. When completed, the page refreshes automatically, and you can view the cable diagnostics results in the cable status

table. Note that VeriPHY diagnostics is only accurate for cables 7 - 140 meters long. 10 and 100 Mbps ports will be disconnected while running VeriPHY diagnostics. Therefore, running VeriPHY on a 10 or 100 Mbps management port will cause the switch to stop responding until VeriPHY is completed.

Label	Description	
Port	The port where you are requesting VeriPHY Cable Diagnostics	
Cable Status	Port: port number	
	Pair: the status of the cable pair	
	Length: the length (in meters) of the cable pair	

#### 5.10.6 SFP Monitor

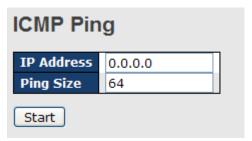

SFP modules with DDM (Digital Diagnostic Monitoring) function can measure the temperature of the apparatus, helping you monitor the status of connection and detect errors immediately. You can manage and set up event alarms through DDM Web interface.

SFP Monitor					
Auto-refresh 🗌 📙	Refresh				
Port No. Temp	erature (°C)	Vcc (V)	TX Bias(mA)	TX Power(μW)	RX Power(µW)
1	N/A	N/A	N/A	N/A	N/A
2	N/A	N/A	N/A	N/A	N/A
3	N/A	N/A	N/A	N/A	N/A
4	N/A	N/A	N/A	N/A	N/A
5	N/A	N/A	N/A	N/A	N/A
6	N/A	N/A	N/A	N/A	N/A
7	N/A	N/A	N/A	N/A	N/A
8	N/A	N/A	N/A	N/A	N/A
9	N/A	N/A	N/A	N/A	N/A
10	N/A	N/A	N/A	N/A	N/A
11	N/A	N/A	N/A	N/A	N/A
12	N/A	N/A	N/A	N/A	N/A
Warning Tempo	erature :				
Event Alarm :					
Syslog					
Save					

### 5.10.7 Ping

This command sends ICMP echo request packets to another node on the network. Using the ping command, you can see if another site on the network can be reached.

After you press **Start**, five ICMP packets will be transmitted, and the sequence number and roundtrip time will be displayed upon reception of a reply. The page refreshes automatically until responses to all packets are received, or until a timeout occurs.

PING6 server :: 10.10.132.20

64 bytes from ::10.10.132.20: icmp\_seq=0, time=0ms 64 bytes from ::10.10.132.20: icmp\_seq=1, time=0ms 64 bytes from ::10.10.132.20: icmp\_seq=2, time=0ms 64 bytes from ::10.10.132.20: icmp\_seq=3, time=0ms 64 bytes from ::10.10.132.20: icmp\_seq=4, time=0ms

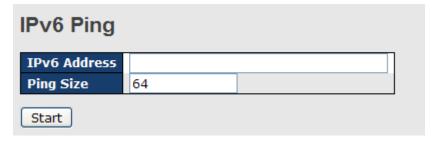

Sent 5 packets, received 5 OK, 0 bad

You can configure the following properties of the issued ICMP packets:

Label	Description
IP Address	The destination IP Address
Ping Size	The payload size of the ICMP packet. Values range from 8 to
	1400 bytes.

### **IPv6 Ping**

PING6 server ::192.168.10.1

sendto

sendto

sendto

sendto

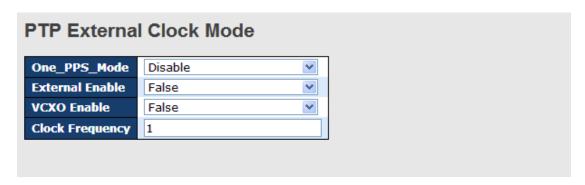

sendto

Sent 5 packets, received 0 OK, 0 bad

### 5.11 Synchronization

#### **PTP External Clock Mode**

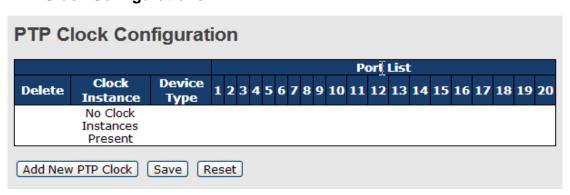

PTP External Clock Mode is a protocol for synchronizing clocks throughout a computer network. On a local area network, it achieves clock accuracy in the sub-microsecond range, making it suitable for measurement and control systems.

Label	Description			
One_pps_mode	The box allows you to select One_pps_mode configurations.			
	The following values are possible:			
	Output: enable the 1 pps clock output			
	Input: enable the 1 pps clock input			
	Disable: disable the 1 pps clock in/out-put			
External Enable	The box allows you to configure external clock output.			
	The following values are possible:			
	True: enable external clock output			
	False: disable external clock output			
VCXO_Enable	The box allows you to configure the external VCXO rate			
	adjustment.			
	The following values are possible:			
	True: enable external VCXO rate adjustment			
	False: disable external VCXO rate adjustment			
Clock Frequency	The box allows you to set clock frequency.			
	The range of values is 1 - 25000000 (1 - 25MHz).			

### **PTP Clock Configurations**

Label	Description			
Delete	Check this box and click Save to delete the clock instance			
Clock Instance	Indicates the instance of a particular clock instance [03]			
	Click on the clock instance number to edit the clock details			
Device Type	Indicates the type of the clock instance. There are five device			
	types.			
	Ord-Bound: ordinary/boundary clock			
	P2p Transp: peer-to-peer transparent clock			
	E2e Transp: end-to-end transparent clock			

	Master Only: master only	
	Slave Only: slave only	
Port List	Set check mark for each port configured for this Clock Instance.	
2 Step Flag	Static member defined by the system; true if two-step Sy	
	events and Pdelay_Resp events are used	
Clock Identity	Shows a unique clock identifier	
One Way	If <b>true</b> , one-way measurements are used. This parameter applies	
	only to a slave. In one-way mode no delay measurements are	
	performed, i.e. this is applicable only if frequency synchronization	
	is needed. The master always responds to delay requests.	
Protocol	Transport protocol used by the PTP protocol engine	
	Ethernet PTP over Ethernet multicast	
	ip4multi PTP over IPv4 multicast	
	ip4uni PTP over IPv4 unicast	
	Note: IPv4 unicast protocol only works in Master Only and	
	Only clocks	
	For more information, please refer to <b>Device Type</b> .	
	In a unicast Slave Only clock, you also need to configure which	
	master clocks to request Announce and Sync messages from.	
	For more information, please refer to Unicast Slave Configuration	
VLAN Tag Enable	Enables VLAN tagging for PTP frames	
	Note: Packets are only tagged if the port is configured for vlan	
	tagging. i.e:	
	Port Type != Unaware and PortVLAN mode == None, and the port	
	is member of the VLAN.	
VID	VLAN identifiers used for tagging the PTP frames	
PCP	Priority code point values used for PTP frames	

### 5.12 Troubleshooting

### **5.12.1 Factory Defaults**

This function is to force the switch back to the original factory settings. To reset the switch, select **Reset to Factory Defaults** from the drop-down list and click **Yes**. Only the IP configuration is retained.

#### **Factory Defaults**

## Are you sure you want to reset the configuration to Factory Defaults?

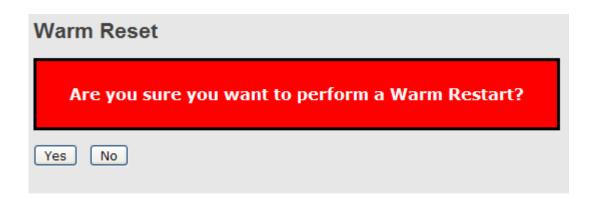

Label	Description
Yes	Click to reset the configuration to factory defaults
No	Click to return to the Port State page without resetting

### 5.12.2 System Reboot

You can reset the stack switch on this page. After reset, the system will boot normally as if you have powered on the devices.

Label Description		
Yes	Click to reboot device	
No	Click to return to the <b>Port State</b> page without rebooting	

## **Command Line Management**

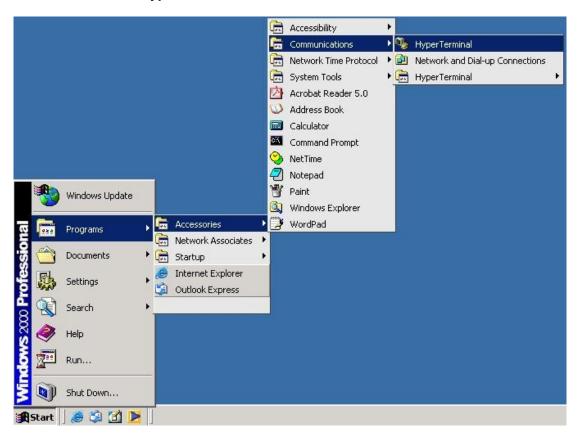

Besides Web-based management, the device also supports CLI management. You can use console or telnet to manage the switch by CLI.

#### CLI Management by RS-232 Serial Console (115200, 8, none, 1, none)

Before configuring RS-232 serial console, connect the RS-232 port of the switch to your PC Com port using a RJ45 to DB9-F cable.

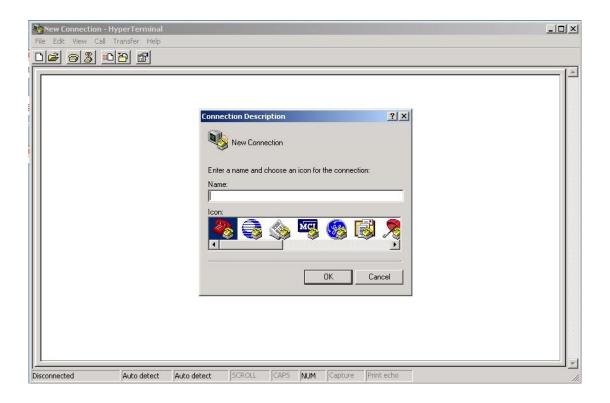

Follow the steps below to access the console via RS-232 serial cable.

Step 1: On Windows desktop, click on Start -> Programs -> Accessories -> Communications -> Hyper Terminal

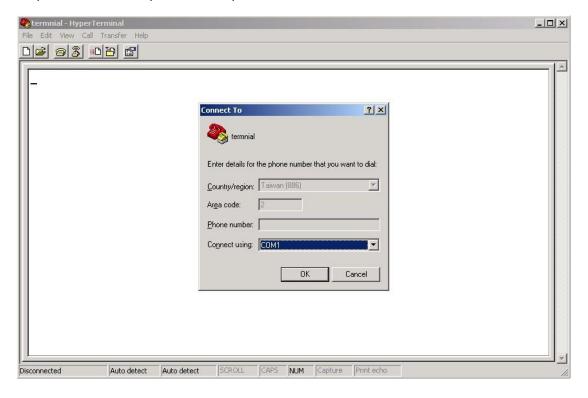

Step 2. Input a name for the new connection.

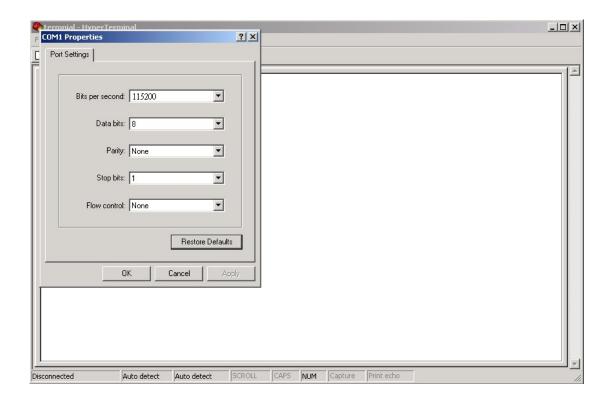

Step 3. Select a COM port in the drop-down list.

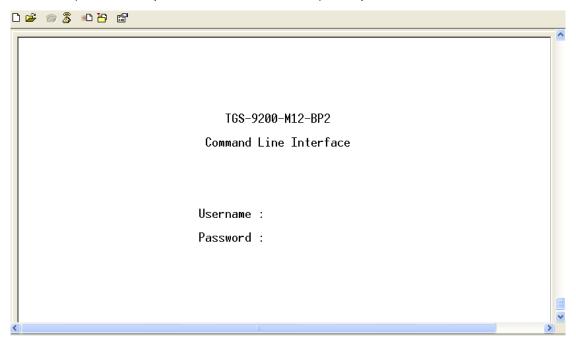

Step 4. A pop-up window that indicates COM port properties appears, including bits per second, data bits, parity, stop bits, and flow control.

Step 5. The console login screen will appear. Use the keyboard to enter the Username and Password (same as the password for Web browsers), then press **Enter**.

#### **CLI Management by Telnet**

You can use **TELNET**to configure the switch. The default values are:

IP Address: 192.168.10.1

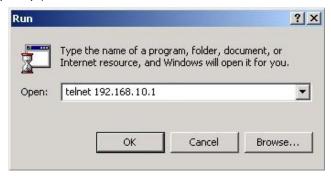

Subnet Mask: 255.255.255.0

Default Gateway: 192.168.10.254

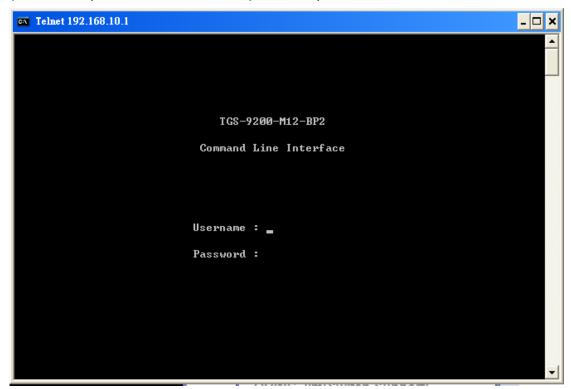

User Name: admin
Password: admin

Follow the steps below to access console via Telnet.

Step 1. Telnet to the IP address of the switch from the **Run** window by inputingcommands (or from the MS-DOS prompt) as below.

Step 2. The Login screen will appear. Use the keyboard to enter the Username and Password (same as the password for Web browser), and then press **Enter.** 

MRP

Modbus

# **Technical Specifications**

ORing Switch Model	TGS-9200-M12	TGS-9200-M12-BP2
Physical Ports		
10/100/1000Base-T(X) ports in M12	20 (0 : 4 !: )	20 (8-pin A-coding with 2 x bypass function
Auto MDI/MDIX	20 (8-pin A-coding)	included)
Technology		
	IEEE 802.3 for 10Base-T	
	IEEE 802.3u for 100Base-TX	
	IEEE 802.3ab for 1000Base-T	
	IEEE 802.3x for Flow control	
	IEEE 802.3ad for LACP (Link Aggregation Control F	Protocol )
Ethernet Standards	IEEE 802.1p for COS (Class of Service)	
	IEEE 802.1Q for VLAN Tagging	201)
	IEEE 802.1w for RSTP (Rapid Spanning Tree Protocol)  IEEE 802.1s for MSTP (Multiple Spanning Tree Protocol)	
	IEEE 802.1x for Authentication	tocol)
	IEEE 802.1AB for LLDP (Link Layer Discovery Protein	ocal)
MAC Table	8k	ocoiy
Priority Queues	8	
Processing	Store-and-Forward	
	Switching latency: 7 us	
	Switching bandwidth: 40Gbps	
Switch Properties	Max. Number of Available VLANs: 256	
	IGMP multicast groups: 128 for each VLAN	
	Port rate limiting: User Define	
Jumbo frame	Up to 9.6K Bytes	
	Device Binding security feature	
	Enable/disable ports, MAC based port security	
	Port based network access control (802.1x)	
Security Features	VLAN (802.1Q ) to segregate and secure network	traffic
	Radius centralized password management	
	SNMPv3 encrypted authentication and access security	
	Https / SSH enhance network security	
	STP/RSTP/MSTP (IEEE 802.1D/w/s)	
	Redundant Ring (O-Ring) with recovery time less t	than 30ms over 250 units
	TOS/Diffserv supported	
	Quality of Service (802.1p) for real-time traffic	
	VLAN (802.1Q) with VLAN tagging and GVRP supported	
Software Features	IGMP Snooping	
Software reactives	IP-based bandwidth management	
	Application-based QoS management DOS/DDOS auto prevention	
	Port configuration, status, statistics, monitoring, security	
	DHCP Server/Client/Relay	
	SMTP Client	
	Modbus TCP	
	O-Ring	
	Open-Ring	
Network Redundancy	O-Chain	
	MRP	
	MSTP (RSTP/STP compatible)	
RS-232 Serial Console Port	RS-232 in M12 (A-coding) connector with console	cable. 115200bps, 8, N, 1
LED indicators		
Power Indicator (PWR)	Green : Power LED x 2	
Ring Master Indicator (R.M.)	Green: Indicates that the system is operating in (	O-Ring Master mode
O-Ring Indicator (Ring)	Green: Indicates that the system operating in O-I	-
	Green Blinking: Indicates that the Ring is broken.	

Fault Indicator (Fault)	Amber : Indicate unexpected event occurred	
10/100/1000Base-T(X) M12 Port Indicator	Up of Green LED for Link/Act indicator.  Down of dual color LED for Ethernet speed indicator : Green LED for 1000Mbps, Amber for 100Mbps, Off for 10Mbps	
Fault contact		
Relay	Relay output to carry capacity of 3A at 24VDC on M12 connector (5-pin A-coding)	
Power		
Redundant Input power	Dual DC inputs. 12~48VDC on 5-pin M23 connector	Dual DC inputs. 12~48VDC on 5-pin M23 connector
Power consumption (Typ.)	20 Watts	20.5 Watts
Overload current protection	Present	
Reverse Polarity Protection	Present	
Physical Characteristic		
Enclosure	IP-30	
Dimension (W x D x H)	260 (W) x 91.6 (D) x228 (H) mm (10.24 x 3.60 x 8.98 inch.)	
Weight (g)	2513g	2535g
Environmental		
Storage Temperature	-40 to 85°C (-40 to 185°F)	
Operating Temperature	-40 to 70°C (-40 to 158°F)	
Operating Humidity	5% to 95% Non-condensing	
Regulatory approvals		
EMI	FCC Part 15, CISPR (EN55022) class A, EN50155 (EN50121-3-2, EN55011, EN50121-4)	
EMS	EN61000-4-2 (ESD), EN61000-4-3 (RS), EN61000-4-4 (EFT), EN61000-4-5 (Surge), EN61000-4-6 (CS), EN61000-4-8, EN61000-4-11	
Shock	IEC60068-2-27	
Free Fall	IEC60068-2-32	
Vibration	IEC60068-2-6	
Safety	EN60950-1	
Warranty	5 years
